were quite good (Decathlon,Ghost Busters,Rampage).
I don't think you're wrong!You'll probably think I'm wrong but that's the
whole point isn't it?It'd be pretty boring if we all agreed with each other!

Here are my faves:

Spyhunter
L.A. SWAT
International Karate
Hall of The Mountain King
Bruce Lee
Feud
Kong games
Gauntlet
Rampage
Ollies Follies
Scooter
Green Beret
Popeye
Decathlon
Bounty Bob Strikes Back

I think I'd better stop now!

First of all my name is Hackney!I use my 8-bit once in a blue moon:purely for
a nostalgic trip.In the UK it is DEAD.Perhaps this isn't so in the states but
anyone who thinks it's alive in the UK is deluding themselves.THAT was what
I was trying to say.

> My comments towards Red Rat were not directly aimed at you, but as
> a message to the rest of the users as well, in a way it helped
> answer one of your questions as to why 8-bit software disappeared
> from the shelves of most UK shops!

Not really;Red Rat appeared when the 8-bits had already started to decline.
I think they were fighting an uphill battle;budget games ended up swamping
the market.

> I did say it was admirable for you to have all legal copies of games.
> My collection of games, more than 200, many more are also all legal
> and I am not some rich person, I saved and bought what I could afford,

> a student. I also sell software that I amd myself have written. There
> are a few UK dealers left so you don't have to buy everything from the
> USA, just look at the Vendors list.

Is the software you talk about better than anything I can get for my PC or
Atari 1040STE?If so EDUCATE ME!I honestly think it's excellent that you write
your own software:what sort of programs do you produce?I also have a confessi-
on to make.When this group was first downloaded I only saw 6 articles!Thus I
thought "Bloody 'ell,is this it?"
This was due to the fact that I'm new to the NET so I accept I was out of
order to say "Liven up!"etc.

> Okay does anybody else think I was out of line with what I said?
>
I think you provoked a good discussion actually,but I am not sad and you shou-
ld reserve such comments for people who warrant it.

Cheers,

>Synapse software, in my opinion, was the best software producer for games.

Ah, Blue Max and Necromancer. Two of the reasons I so loved Synapse. The other title I can't live without is MULE. I found it interesting that in a recent PC games magazine where they listed the greatest PC games of all time the best known PC programmers all talked about their love of MULE, Star Raiders and even Ali Baba. Heck, one guy refused to play MULE because he was jealous that someone else had created such a perfect game.

ANyone else even been assaulted while playing MULE? My friends tend to immobilize me for the last two or three auctions so that I won't beat them.

Darek Mihocka told me that you have to have a *VERY* good video driver (for Windows) to allow PCXF to function in a window. I was unsuccessful in my attempts to do so with a cheap Trident-equipped clone (albeit a new 9400 series).

Things did work "full screen" under Windows, but it seems like Windows doesn't allocate processor time consistantly. Ever try running a benchmark in a window? You get wildly varied results. Seems like I had similar luck trying PCXF with Windows.

I have the following Atari 8 Bit items for sale to the highest
offer. I would naturally prefer that the interested parties be
within driving distance, so that they could actually SEE and
operate any system that they are interested in (I'm in N.E. Ohio).
However, I realize that that would be severely limiting the pool of
prospective buyers. Be assured that all items are in perfect
working order. All memory upgrades were done by myself, as well as
any mods and normal maintenance.

Atari 600xl (64k)
Atari XEGS (128k)
Atari 800 (48k)
Atari 800 (188k)
Atari 1200xl (1 meg ... this one will be hard to pry from my fingers!)
Percom SS/DD disk drive
Atari 810 disk drive (Happy enhanced)
ICD PR:Connection (new)
Avatex 1200 baud modem
Atari 130xe (320k)
ICD MIO (1meg)
30meg SCSI HD (two 13.5meg partitions)
Basic XE cart.
2400 baud modem
Commodore 1802 monitor (NOT perfect; occsionally needs to warm up)

I will personally check out any item prior to shipment. I'm a
Sr. Electronic technician, and hold an Extra Class FCC Amateur Radio
license. These items were well cared for. As mentioned, I'd prefer
a local buyer, but I will ship to continental U.S. locales. If you
are SERIOUSLY interested in any item, you may contact me at:

aj445@po.cwru.edu
cooncat@ix.netcom.com
kb8eb@wa8bxn.#neoh.oh.usa.na (packet radio)

Bill Somrak
(NOT leaving the Atari 8 bit community for good. I'll ALWAYS keep at
least one system up and running, for old times sake!)

Thanks for the getting the answer for me Russ. It's seems like Tom thought
I had some kind of axe to grind. Nothing could be farther from the truth.
As far as shareware fees go, I've never used one of Tom's programs, as good
as I've heard they are, so I'll not be sending any. Simple story really,
a number of statements were made about authors creating SD only program
to force people to use it against their will, Tom's name was mentioned along
with several others. I was a member of CI$ back when Keith Ledbetter was
still a sysop (He may still be, but only ST?), & he was also mentioned as
a SD groupie. Since I was there at the time & still had the docs from some
of the programs, I was able to dispell some of the rumors/site the author's
reasons for recomending one DOS over anouther etc. With one exception, I'm
not really familiar with Tom or his work. I was expecting a little more
technical of an explaination, something like my program needs xx bytes
for code & xxx bytes for buffer which I only get with SD, but the
explaination he gave is perfectly valid.
For the record, I only use SDX, MyDOS, & various flavors of Atari DOS.
The main reason I use SDX is so I can have two carts in the computer at
once, the main thing I use MyDOS for is SIO2PC which most people probably
realize, I have more then just a passing fancy for. I probably could be
described as a SIO2PC groupie.
It's only an opinion, but it seems like Tom's been bashed so much about
SD he's getting a little sore. Sorry for all the typos, but we're leaving
to go skiing in about 10 minutes & I'm in a little hurry.
Rick

1470. LineUp

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-16 15:50:47 UTC
From: kendrick@zippy.sonoma.EDU
Message-ID: <9502161551.AA11367@zippy.sonoma.EDU>
Source record: 94314

Ok.. I got LineUp last night (along with a bunch of other Newfiles stuff from UMich) and converted it from DCM to ATR. It got some header error at sector 1039 but I just ignored it and hoped it would work.

I loaded up SIO2PC and booted up my 800XL (trying to remember this new alien idea to me: holding down [Option] as I booted!).

I was sorta worried about the jumping around with the sectors... 30-240 400-620, 10-30, 620-700, 240-400.. Those of course aren't real numbers, but it did jump around more or less like that.

Then the title screen appear. VERY very crisp, clear digital music played (unfortunately just one riff sorta like how RubberBall's is, but again, very crisp and a little longer). Along with that is a big nifty looking Graphics 9 title screen saying "New Age Presents" "LINEUP". I noticed a slight slight flicker and examined the screen again "HEY! That fading is SMOOTH!"

They must've used some APAC-style Graphics 9 screen to give more than 16 shades of grey on at least that part of the screen. Very nice.. I'd like to see JView do something like that for 256-grey images! :) :)

Then after I (disappointedly, admittedly; too used to Mac Centrises and PowerMacs) figured out that that's all it did and that's all the music it played, I hit a few keys trying to find out how to continue.

After more nearly-random loading a giant letter "L" zooms out from right in front of me and settles on the left side of the screen. Then the "I", "N", "E", dash, "U" and at the right, "P". COOL! Nice effect!

A medium-sized square in the lower center of the screen sorta opens up and there's a very nicely drawn (hard to tell how many colors per scanline; probably just 4 but it was drawn with extra special care) picture of a Joystick with a flashing red arrow pointing at the fire-button. (Oh, and this is one of those ORIGINAL 2600 style joysticks). Nice profile.. ooh, a scroller.

I can't tell what the NAME of the person is who wrote this excellent looking software, but they're speaking spanish (which, even though I 'studied' it for two years, I suck at very much (typical American, eh?)) and seem to be from Chile.

The music playing at first sounds like they were cheap and just twiddling with that 9th audio byte (AUDCTL or whatever) but it ends up sounding more and more like music with just nifty and atypical effects. Cool.

I finally hit "fire" and HEY! IT'S COLUMNS! Cool! I WAS going to try to write a columns game but now it looks like I don't have to! Aww.. but

wait. Too few colors on the screen! :(Oh well! Still a neat game!

I play up to level 13 or so, noting things like the aforementioned "cool
effect" during game Pause, the timed levels, and randomly placed pieces..
as well as some cool "already-there" pieces (little rat-skull and crossbones?).

Anyway.. I must say, this is a work of art. From beginning to end it's a very
nice game. Very impressive graphics! (Again, except the sad 4-colored IRG
mode for the game itself; I guess I'm biased because I'm working on designing
better page-flipped (APAC/ColorView/FlickerTerm-style) IRG modes with more
colors..)

Soooooo... I feel this is the best 100K I've download all year! (Except that
one sultry picture of Cindy Crawford: SHE ACTUALLY DOESN'T LOOK UNATTRACTIVE!
WOW! (I find her and Kathy Ireland sorta... ugly)

Well! Bye!

AK> someone's mistaken. This coutry of people who try to turn in eachother.
AK> DISGUSTING !

So is stealing. You don't like people complaining about you stealing, then stop stealing. It's not complicated at all.

And if you don't like this country, I'm sure there are millions who would love to trade places with you in Eastern Europe and the Orient. Go back wherever you came from and send one of them over in your place.

AK> Yes yes yes. Why should i pay for soft that is free in eastern countries ?

It is "free" in Eastern countries because it is stolen there and the governments don't care. Here, there are a very few honest cops, and a whole lot of honest sysadmins and sysops - and many of them write the software that you are so proud of stealing. If you were to grow cabbages, and someone stole some of your cabbages when you were expecting to sell them so you could pay the rent, or feed your children, you might be a little upset. In this country, we don't usually beat the shit out of people who steal. We just put them in jail. Then the ex-pro-athletes who are also in jail beat the shit out of them for us.

For what it's worth, I went to B&C today (2/16/95) and bought a copy of M.U.L.E. right off the shelf. And I don't even *have* an Atari 800 right now, though I'm hoping to pick up a system soon. I just knew that I had to buy the game while I had a chance to do so...who knows when I'll see it again?

Whether they had any more in stock, I don't know (there was only one copy on the shelf). But they definitely *did* have a copy. So if they ran out of stock before, they must have received more merchandise--therefore, it may be worth a call to find out if they have any more.

You can gauge this game's popularity by its price: $29.95, while all the other EA games next to it on the shelf ranged from $9.95 to $14.95. Ah, supply and demand... :)

Yep. Keep in mind that a typical application for an Atari 8-bit has
(perhaps) one or two floppies, which total under 300K (say). You could
put well over 100 such applications on a 40 MB hard drive.

The Atari 8-bit stuff used less hard drive space than the even the oldest
MS-DOS stuff. And many people did just *fine* with a 20 MB fixed disk drive.
Simple MSDOS-based word processors use less than 1 MB. I have an old
copy of Turbo C which uses under 2 MB, total.

Until VGA games with lots of bit-mapped graphics came out--and until DOS
users starting running Windows--120 MB was a *huge* hard drive.

>I do have to wonder at the folk (not you Lonnie) who have posted about
>wanting to use gigantic hard drives with their Atari 8-bit machines, i.e.
>half-gig or larger.

Yeah. It's not like we're running Windows. GUIs have an incredible
appetite for hard drive real estate.

I just discovered that SIO2PC can actually be used as a null modem!
This needs a SIO interface like 850 or P:R:.
What you do is this:
Both 850 interface, and SIO2PC must be daisy-chained to the Atari.
Boot up any terminal program you'd normally use with the Atari.
Turn the modem off, and leave the interface on.
Boot up a comm program on your PC, and tell it to look for the modem in the
COM port the sio2pc cable is plugged into.
Set both computers to use the same baud rate (any one you like, I think the
max is the same as the interface's max - 9600 for the 850 interface.)

That's it! Anything typed on your PC will appear on your Atari's screen
and anything typed on your Atari will appear on your PC's screen. File
trasfers work nicely, although Kermit simply "aborted" at a certain stage,
for no apparent reason, at 9600 baud (4800 was ok). Haven't tried any other
protocols because I don't have other software for the PC.

This is all very cool, but pretty useless, since anyone with sio2pc has
good enough file-xfer methods without messing around with terminals and
file-transfer protocols.. But it was truly amazing to see it work as if
I had a null-modem cable..

In the virtual disk editor I'm writing, I keep getting error #164, file number mismatch, when I use byte 126 (254) of a sector, the file# in Atari DOS, as the hi-byte of a 16 bit forward pointer.

Byte 127 (255) is the lo-byte of the forward pointer as usual, and 128 (256) as the sector byte count(as usual). In order to access more than 1023 sectors, a 16 bit pointer has to be somewhere, in order for Mydos to access its maximum 65536(5?) sectors. Hmm...

Maybe it's low byte, then high byte. I just assumed Mydos used the lower 8 bits of the original documented forward pointer as it low byte for compatability. I think I'll try it out.

If you have one of these gathering dust in a bos in your closet or garage, I'd be interested in taking it off your hands. Please reply to this account if you're interested. Include the hardware/software you have as well as your asking price.

I'm in San Jose, and I'd prefer to deal locally so I can *see* that the system works before I pay anything.

I have an old magazine called Atari Connection, I probably received it twelwe years ago. There is a LOGO vs BASIC comparison in this particular issue, but also many articles with interesting information about the Atari community, circa 1983. My overall impression is that the magazine really captures the special feeling that IMO existed during those early years of the Atari 8-bit computer era.

Does anybody know during what years AC came out, and also, if anybody out there is willing to sell off old issues, I'm interested in buying at a reasonable price. I don't need original condition or anything close to it, as long as the stuff is readable. I will pay in advance.

Yes

>I also
>think you (he) did several games for Red Rat software which would
>explain your inside knowledge of Crumbles Crisis!
Your right - Crumble's Crisis and the followup Space Lobsters and then
moved on to Tynesoft, Atarisoft and finally Zeppelin in 1991.

I sold Crumble's Crisis to Red Rat outright, but I think the contract
said something along the lines of the copyright returns to me after 5
years - I will dig the contract out and if this is true I could upload
the game to Umich!

But first I have to get my atari talking to my PC.
A friend and I are in the design stage for an atari joystick port to PC
serial port transfer - any help offered would be welcome - I am still
looking for information on the DCM format.

As far as popularity goes, I read in something like Computer Gaming World about a year or so ago it was on their top 10 all time list. I can't recall all the other titles, but it was up there with the original Dungeon Master on the ST, Bard's Tale, & maybe one of the Ultima(s). Pretty good company anyway. And now for an embarassing admission, I've never played M.U.L.E. B&C is local to me also so I may have to make a trip over there to try and get a copy.

Hello,

I am writing this for a friend of mine so please direct the replies to him.
He has the following items for sale:

2 Atari 600xl computers with manual and cables
2 Atari 1010 recorders
SAMS Basic tutorial books and other programming ref manuals
2 joysticks
2 wireless joysticks (GameMate II)
cartridges (in good shape):
-Attack of the Mutant Camels
-Frogger (Sega)
-GridRunner (with manual)
-Zaxxon (Sega)
-Microsoft BASIC II

if interested in any of those items please call, George Pateman at
day - 908-668-6182 or night - 908-549-7611. Best offer on individual pieces
or a whole package. If you really don't feel like calling drop me mail to
smok@ritz.mordor.com and i'll forward it to him in person.

I couldn't get PCXF to run in a window under Windows, but it works fine in a Window under OS/2 Warp. It's actually kinda cool, I can bring up multiple windows, and have different things going on in each one!! I'm really tempted to upgrade to 3.0, but I haven't heard too many good things about running games under it. (I would love to be able to play Gyruss or Mr. Do at work!!!)

Is there a success list for games under PCXF?

I have seen a PC clone called MULE386 at wuarchive.wustl.edu. However, I've never managed to get it to work. Other have said it's pretty good.

Dan Bunten was going to do a PC clone, but refused when the publisher asked for guns and bombs. (Got that tidbit from a PC games mag which seems to feature regular letters asking where MULE-PC is!)

There's something called "Mule386" which I can't get to work, nor can
many people I've contacted who have tried.

BTW, has anyone tried to run M.U.L.E. on PC Xformer 3.0? I'd be curious
to know how faithful the sounds and graphics are to the real thing running
on the 800.

Oops. The message seems to have gotten garbled. PCXformer emulates the Atari
on the PC, not the other way around. The only way to run MS-DOS on an 8-bit
that I know of is to use the Co-Power 88 board on an ATR-8000.

Atari 8-bit computers (henceforth referred to simply as Atari computers) can really invade one's life. A game here, a color plotter there, and pretty soon you're surrounded by Atari computers, peripherals, software, books and do-dads.

This article is meant as a warning to all those who are contemplating getting into the Atari habit. You may think you can skirt the edges, use only a few game cartridges and an Atari 400. Don't be fooled! As a hardcore addict, I can tell you honestly that just isn't possible. What follows is a brief description of my own descent into Atari madness.

As has been said before, my original Atari computer was purchased in the very early 1980's. It was wonderful, and I had a lot of fun with it. On it I had my first experiences with programming. I even wrote a (unpublished) short-story using my Atari and AtariWriter. But, eventually I felt I had to move on to a computer that was more serious and useful.

Next came an Apple //c. That was a really nice computer, too, but something was lacking. Sure, the games were plentiful (even as the Atari section at most software stores was disappearing). And the programming languages and utilities were first-rate (thanks to Beagle Brothers Software). But the graphics were primative. Sprites? ha! And the sound was unacceptable, having heard Atari's wonderful sound chip in action.

Five long years later, I moved on to the ultimate "serious" home computer: an MS-DOS box. I also got my first modem at this time. Whee! I experienced CompuServe's CB Simulator, where I met my current girl-friend. (I also met a number of HUGE CI$ bills, but that is another story.) I set up a BBS, and was gratified to have a fair number of regular callers. I also met some realy great friends through this medium. This was all great, but the ache, the feeling that something was missing, persisted.

I programmed a bit on the IBM, using Borland's C++ compiler. I even released a few programs for the first time. Most were freeware, but I felt confident enough about one to offer it as shareware. Programming that machine awakened me to the limitations it had, as compared to my old Atari. Sure,ithad a blazingly fast processor. It had an incredible display at 640x480 in 256 colors. But where were the sprites? More important, where was that magical feeling I got when using the Atari?

Through my BBS I met a friend who collected Atari computers. We got to talking about them in E-Mail, and I learned how cheaply they could be acquired. I thought, why not? What could it hurt to get an Atari computer and a few games, just for old time's sake? Oh, if only I had known!

I started with an 800XL and a 1010 Program Recorder. I bought them at a price that was next to nothing ("The first one's free, Kid."). I then acquired a few games (including Star Raiders, of course), and got to relive some old times. It felt good. Real good.

I then wanted to try my hand at programming again. I bought some books, and played around a bit. How easy it was to slip back into the comfortable folds of Atari BASIC. Pretty soon I was enjoying the phenominal graphics that only an Atari can produce. And that magical feeling was back! I was truly hooked.

In no time I was frequenting flea markets and garage sales, in hopes of finding Atari compuers and accessories. I had become an Atari Bum. Soon I had boxes and boxes filled with Atari items stacked around my house. to fill in my collection, I began ordering from the various Atari dealers still in existance.

Even so, it was just a hobby, I told myself. When I wrote reports for college, I still used the MS-DOS machine, after all. I even bought an occasional MS-DOS game. And, of course,I still called out on it. Who wants to call out in 40 columns when they have an alternative?

As my collection grew to include some of the better Atari devices and programs,I began using it more and more. Word processing was an easy change. I never was comfortagle with the weird ALT-F-Key combinations required in Word Perfect anyway. AtariWriter was simple to use. I could be more productive, I told myself. And the output from my printer is the same no matter which computer it is hooked to. No problem. I could handle it.

Within a couple of months, I discovered the SynApps series. I could track stocks, do a household budget, and make a database of my Atari collection, all on my Atari! They were so easy to use, too! I told myself, "These are all great programs, and I really shouldn't let all this Atari equipment go to waste anyway." The obsession grew.

The final blow was FlickerTerm-80. Now I had no reason not to use the Atari for telecommunications, the final task I used my Intel machine for. My obsession had taken over my entire computing life.

I met a lot of like-minded people online, and began tothink that I didn't need to hide my dirty little secret from the world. I "came out" to my friends and colleagues, admitting I used an Atari computer exclusively at home. Yes, the guy they called "computer guru" was an 8-bitter. Oh, the shame! The shattered image!

Surprisingly, they accepted it, although they never understood why I would "restrict" myself so. The expected taunts of "Atari boy" and

"8-bit brain" never came.

Now, I am lost in the world of Atari, unable to get through the day without a fix. I spend my time planning things to do with my Atari, looking forward to using it. When I am not using my Atari, I spend every free moment thinking about it. All the classic signs of addiction are present in me.

The amazing thing about the Atari addiction is that the highs never diminish. Unlike other drugs, the human body does not appear to develop a resistance to Atari. Each high is as exquisite as all the previous ones.

That does not mean an Atari addict doesn't always want moe. Quite the contrary, the next big deal is always just around the corner. Software, hardware, books and memorabilia. Oh, the need is constant!

So if your beloved has begun talking about getting back into Atari, beware! She or he is embarking on a road without end that will consume all of his or her computing cycles. There is nothing that you can do to stop it, but it ismy hope that by writing this I can help loved ones minimize the damage.

I have to go now, though, because I hear that a guy on the 'Net is selling Atari 822 printers for $10 each . . .

I am a NEWBIE to the Atari 8-Bit World--- And, to conserve desk
space, I am using the PC Xformer... :) --- I was curious if anyone else
has very much experince with that (?) --- I have downloaded some files
but don't know how to copy them to my virtual disks- I downloaded ARCX.COM
- and copied it to a VIRTUAL image file, but it kept locking up when
I tried to run it off there... ??? Please advise (PS- The EMULATOR would
lock-- not my computer --- I could still press F10) I am interested
in seeing some GOOD games to play on the emulator--- any sugguestions?

THANX! -=[WAD3]=-

Thanks for the information. I had been looking around for that mod for a long
time. I tried deciphering it myself but never could come up with the proper
connections. I'll try to hop into Cleveland tonight to find it.

One of my favorites was a game put out by "Rapidfire by SSI" called FORTRESS. It is a board game ala chess. The object of the game is to build castles in stages and control adjacent areas of the board. The player with control of the most squares at the end of the game wins. The unique part of this game was that it was one of the earliest attempts that I had seen at AI. This game "learned" as you played and would increase in ability. There were several levels of players, just like the current chess programs.

The game was written by Jim Templeton and Patty Dembrook and published by SSI in 1983. It requires XLfix to run on later machines and was available as an Atari/AppleII flippy disk.

1513. Re: VGA card (was: Ever a workable 80-column mod)

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-18 05:51:29 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <hyyakKp.lmcclure@delphi.com>
Source record: 94353

In a message dated 2-15-95, James Hague said:

"I do have to wonder at the folk (not you Lonnie) who have
posted about wanting to use gigantic hard drives with their
Atari 8-bit machines, i.e. half-gig or larger."

I can only assume they are either following the old axiom, "One can never have too much memory or hard drive space", or they either plan on having a lot of graphics and/or sound files (which can chew thru drive space like a power saw through wood), Also, they might plan on running a 8-bit based BBS with plenty of files, perhaps even including files for other systems.

Once FTe's Sweet 16 and MIO-II hit the market, it will not take long for someone to say, "Hmmm, a few megs of linear memory and a bi-directional parallel port", and notice Amiga sound digitizers all plug into the parallel port. Output could be either the internal Pokey chip, or for better quality, an 8-bit DAC connected to the parallel port, or even a really cheap resistor ladder (like Tandy used in their Orch-90 cart for the CoCo).

Darn, I just gave away my idea for the Sweet 16 programming contest! <grin>

Oh, well, as busy as I am, I likely would not get around to it anyway.

BTW, for those who are curious, I have confirmed with Mike at FTe that the MIO II's parallel port is to be bidirectional.

Also, while I am passing out programming ideas, here is another: a parallel version of SIO2PC. However, since IDE drives could be connected to the MIO II, the main purpose of such should be on easy and fast file transfer, and using the PC (especially if VGA or SVGA equipped) as "super" XEP-80 emulator. The driver could load in place of the normal XEP-80 driver, and act exactly as it, or one could load a superset driver that would also support 16-color text and graphics functions.

1514. Re: DCM and ATR

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-18 06:37:56 UTC
From: richczeta@aol.com
Message-ID: <3i44k4$ejb@newsbf02.news.aol.com>
Source record: 94207

Here's the SIO2PC doc:

STRUCTURE OF AN SIO2PC ATARI DISK IMAGE:

It's extremely simple. There is first a 16 byte header with the following information:

WORD = special code* indicating this is an Atari disk file
WORD = size of this disk image, in paragraphs (size/16)
WORD = sector size. (128 or 256) bytes/sector
WORD = high part of size, in paragraphs (added by REV 3.00)
SPARES 8 (ten) unused (spare) header bytes (contain zeroes)

After the header comes the disk image. This is just a continuous string of

bytes, with the first 128 bytes being the contents of disk sector 1, the second being sector 2, etc.

* The "code" is the 16 bit sum of the individual ASCII values of the string
of bytes: "NICKATARI". If you try to load a file without this first WORD, you
get a "THIS FILE IS NOT AN ATARI DISK FILE" error message. Try it.

On double-density images, the first 3 sectors take 256 bytes, but only the first 128 of each are used. This is incompatible with the current release of PC-Xformer. The author is aware of it.

Hope this helps!

Check out my Atari New User, Emulator Help FAQ (rev.0.7) for help. You could be trying to run something with BASIC on which doesn't like it, or it could be a "what DOS you're using" problem, or just a "don't work with PC XF 2.5/3.0" bit of software.

I suggest using SuperUnARC anyways :)

CC> how to load Basic files from disk.
CC> Is it like LOAD "FILENAME.EXT",8,1 or something like that?

Close... unlike the C64, which uses a trailing disk designation,
the ATARI 6502 8-bit DOSes --PREPEND-- the disk designation onto the
front of the filename, e.g.

LOAD "D1:FILENAME.EXT"

...rather than using trailing designators. "LOAD" is used for
tokenized BASIC programs (which usually use a ".BAS" extender). "ENTER"
is used for ATARI ASCII (ATASCII) BASIC source code listings (which usually
use a ".LST" extender), e.g.

ENTER "D1:FILENAME.EXT"

You create a tokenized BASIC listing with SAVE, e.g.

SAVE "D1:FILENAME.BAS"

...this is only safe to do with ATARI BASICs, revision A and
revision C (brown cartridges and silver cartridges, respectfully), or the
800XL builtin BASIC only after it has been patched in RAM.

You create an ASCII listing of a BASIC program with LIST, e.g.

LIST "D1:FILENAME.LST"

A "D:" is a "disk device". Device "D1:" is the "root directory".
Device "D:" without a number is the "current working directory".

If you attempt to LOAD an ATARI file that is --NOT-- a
tokenized BASIC p-code listing, you will recieve the dreaded:

ERROR #21

In this case, try using ENTER instead of LOAD.
Good Luck!

Gee ... GMTA.

That, and a parallel port transfer mechanism of any type, is what
got me thinking about the speed and interfacing possibilities for
TTL and Open collector type lines (my post regarding SIO speed
limits).

What I have in mind would try like heck to use exactly two
joystick ports, or one half of an added PIA chip, and an IBM
printer port. At least a basic transfer routine would be able to
use the first two ports anyways, to give a straight wire
connection with no transistors or ICs involved.

An excuse to learn more about the limitations of IBM printer
ports, some of which are true bi-directional, some of which are
not, and some (older ones) are easily modifiable. (Darn, just
thought of something else to check out on my desktop 286
motherboard ... hope it doesn't take long to check)

```
The Atari 8-bit Hardware Upgrade,
Modification and Add-On FAQ
==================================

| | |
| | |
/ | \

Version 0.1

Dated February 18, 1995

Maintained by: David A. Paterson
Mailto:d.paterson2@genie.geis.com

INTRODUCTION

This is a very basic version. I intend to add as people give
feedback to what they want to see, and how they want to see it.
Any info you have is more than welcome!

PURPOSE

This FAQ exists to describe the various hardware
modifications available to the Atari 8-bit user. It does not
teach you how to do them. It definitely doesn't take any
responsibility for the results if you do try them. But it will
try to give you some information about where to find more
information, which upgrades (or "hacks") are best, and who to
consult if things go wrong. For addresses and phone numbers of
any of the companies listed, consult the Vendors and Developers
List, posted at or about the 15th of each month.

It also exists to describe the many wild and wonderful
products that have been produced for the Atari 8-bit. Many are
unique, some may be apocryphal. Mainstream items like printers,
modems, disk drives and cassette decks are all excluded.
Temperature gauges, combination printer buffer/ramdisks that run
through the joystick port, and other such are fair game.

POSTING FREQUENCY

This FAQ is posted whenever I remember to post it. It is
posted to comp.sys.atari.8bit.

PART I - RAM Upgrades

General

The 6502 microprocessor at the heart of every Atari 8-bit has a sixteen bit wide address bus. What this means is that it can access up to 2^16 memory locations. That's 65536 bytes. Some people, wanting more memory, came up with a variety of techniques to use more memory. Most were built around the idea of bank switching. Bank switching means that you swap chunks of memory around so that the CPU can see them when necessary. Most schemes use 16k banks, though 4k and 32k have also been tried.

Atari 400

The original Atari 400 had either 8k or 16k. Atari produced a board with 48k. Mosaic produced a 32k board, as well as a 64k board with 48k RAM plus 4 4k RAM banks. (ANL 13, IFC)

Atari 800

The Atari 800 came with three memory slots. Each slot could contain Atari 8k or 16k RAM boards. Mosaic produced 32k and 64k boards. Three 64k boards could be combined for 192k.

Axlon produced the 128k RAMdisk board. It banks 16k, using $CFFF as a control register. Banked memory appears from $4000 to $7FFF.

David Byrd created the "800 PLUS 288K UPGRADE" which rewired existing 16k RAM boards, but required additional work to become fully Axlon compatible. A nasty sort of flame war erupted between

David Byrd and Jay Torres of the Windhover Project over who invented the upgrade.

Magna systems produced 256k, 512k and 1M boards which followed the Axlon standard. (ANL 65, 68)

Atari 1200xl

See 800xl.

Atari 600xl

As shipped, the Atari 600xl came with 16k RAM. Atari released the 1064 memory module which expanded the 600xl to 64k. MPP, now Supra, produced the Microram 64k Memory Board (ANL 19, 28)

RC Systems produced three expansion modules for the 600xl, raising memory to 32k, 48k or 64k (ANL 26, 12)

Richard Gore produced the Yorky, a 256k board which plugs in to the PBI. It provides full compatibility with 130xe type banking. It is for use on 600xls upgraded internally to 64k, or on 800xls. (AC 3/2, 10)

Atari 800xl

The Atari 800xl came with 64k RAM internal. To access RAM hidden under the OS ROMs, the PIA chip was used (PORTB, used for STICK(2) and (3) on the original 800). Claus Bucholtz published plans for a 256k upgrade which banked 32k at a time using PORTB for control in Byte magazine. (Byte Sept 85)

ICD released the RAMBO upgrade, providing 256k in 16k banks, using PORTB. Newell came out with the 256k XL, which would work on a 1200xl or 800xl, providing 256k total memory, . The two upgrades used different sequences to access their banks. (ANL 44, 115)

Charles Bucholtz updated his upgrade to use 16k banks after the release of the 130xe. Most of the 800xl upgrades can be made compatible with Antic banking. The only possible problem would be when Antic and the CPU are supposed to be using different memory banks.

The Yorky will also provide 256 on an 800xl (see the entry under 600xl).

Newell released 1Meg and 4Meg upgrades for the 800xl. These banked 16k as well, and required disabling internal BASIC to properly access the memory.

Fine Tooned Engineering, having bought the rights to ICD and Newell's products, is bringing out a third method in the Mars 8. Though not yet released, it will use SIMMs for 256k, 1Meg or 4Meg

RAM.

Atari 130xe

The 130xe was the first "official" method of banking memory. It too used PORTB, but with an added twist: ANTIC and the CPU could access different banks. This provided headaches for some owners of "older" upgrades, but few programs took advantage of this feature (SpartaDos Wedge and VideoBlitz demo only). Upgrades for the 130xe include replacing one set of 64k chips with 256k chips, raising the RAM to 320k. Adding another 256k for 576k total has also been done. These were designed by Scott Peterson, as was a 1088k upgrade.

PART II - Video

Upgrades

The most common video upgrades are the SuperVideo series, described in AC 2/6. Plans were provided for the 600xl, 800xl, 1200xl and 130xe. The SuperVideo upgrade provides the forgotten chroma signal on the monitor port. It corrects a number of errors in the parts in the Atari video circuit, resulting in a clearer image, particularly on monitors.

Providing TTL output was also covered in AC 2/6. Bob Woolley provided plans for the circuit, as well as instructions for getting TTL output from an XEP80. Be warned that the output is not in the standard Atari colours; on a CGA type screen, the sixteen possible shades are translated into eight colours.

80 column devices

Since the 400/800 were released in 1979, people have been clamouring for better text displays than the default 40x24. Two products were released for the 800: The Austin-Franklin 80 column board and the Bit 3 80 column board were both for use in the Atari 800. They replaced the third memory module. The Austin-Franklin board came with a "Right Cartridge" which provided the drivers. Removing the cartridge disabled the board. Some software would not run with an 80-column board installed.

Ace 80/80xl was a cartridge released which provided 80 columns by using bitmapped graphics on an 80 column screen. A similar technique was used in the Newell Omniview, an add-on for their Omnimon.

Atari's entry into the 80 column field was the much maligned XEP80. For maximum compatibility, the XEP80 attaches to the computer via a joystick port. It includes three character sets, 8k internally, and a parallel printer port. The software provided by Atari supports a 320x200 graphics mode. This mode only supports direct bit images. Hacks have been released which hook

the XEP80 on via the parallel bus.

Genlock

In October and November of 1991, Michael St Pierre published articles in the SLCC Journal describing plans for a monochrome Genlock. A genlock is a system to synchronize live video with a computer image. Graphics can be overlaid, faded in or out, or used for titling.

In 1994, Michael announced Prism Studio, a full colour genlock. It is sold by Mytek.

PART III - Operating Systems

Computer OS
-------- --

400/800 Rev A. No self test; Memo Pad mode.
Rev B. Fixes several bugs in Rev A.

1200xl XL OS. Some incompatibilities with 400/800 OS

600xl/800xl Revised XL OS. Includes parallel bus handlers. Internal BASIC.

65xe/130xe Revised XL OS. (as above)

xegs Modified XL OS. Self-test mode changed.
Internal Missile Command and BASIC.

Operating System upgrades

UltraSpeed + OS : from CSS. Supports high speed disk communication. Drives 1 through 9. Any RAM upgrade. Includes three modes: standard xl/xe OS; 400/800 OS; UltraSpeed+ OS. For XL/XE systems.

Omnimon: from Newell. M/l monitor for 400/800. Installs into $C000 page of memory, otherwise unused.

RAMROD OS: from Newell. Replacement for 400/800. Includes accelerated floating point math package.

RAMROD XL: from Newell. OS speed-up routines, fast math, and Omnimon. Includes option for second OS.

XL Boss: from Allen Macroware. OS replacement for XL model computers. Includes m/l monitor. 400/800 OS compatible.

TurBoss: available from KP and Best. Fast math and fast screen routines. For XL/XE computers.

PART IV - Other Neat Stuff

Zucchini

In ANL 59,60 and 62, Dr. Lee S. Brilliant provided plans and software to turn a surplus Atari into a printer buffer for another Atari. He called it "The Atari Zucchini".

The Printer Buffer Routine (PBR) and Disk Emulator Routine (DER) came from B.L. Enterprises. They were cartridges and cables which worked in a similar fashion to the Zucchini. The PBR provided a buffer, while the DER emulated a disk drive on the remote computer. Stock XLs gave 403 free sectors; a 130xe would give 914. (ANL 65, 67)

Voice Master

Covox sold the Voice Master and Voice Master junior. These would capture and record speech. Bundled software attempted recognition of commands, with limited success. (ANL 47, 44)

Parrot

The Parrot was a sound digitizer sold by Alpha Systems. Resembling a paddle, the device had phono jack for input. Antic provided plans for a similar project, called the Antic Sampling Processor. (ANT 8/8, 11)

SoundMouse

Among the more esoteric products ever released was the SoundMouse, which interpreted sound to provide a reading on a paddle register. It did not act as a digitizer, like the Voice Master and Parrot did.Bundled software made the lava lamp look mainstream in its appeal. No commercial applications taking advantage of this unique device were released.

Gumby

Chuck Steinman of DataQue created this set of plans for building stereo sound by installing a second Pokey chip (Pokey and Gumby, get it?). Once installed, the second channel has all its addresses 16 bytes higher in memory ($D210 - $D21F). A small number of demos have been released in stereo. ftp://atari.archive.umich.edu/Atari/8bit/Sound/gumby.arc

PIA2

With the use of PORTB for RAM banking, hackers were looking for more parallel outputs. This plan, for adding one more PIA chip, includes notes for adding two more. It was intended as a means to control large RAM upgrades. (AIM 3/2, 16)

Critical Connection

A long time ago, in a galaxy far, far away, was a mystic operating system known as CPM. A company named USS Enterprises produced the Critical Connection, a device to permit a CPM computer to emulate disk drives for the Atari. It was a cable,

plus software for the CPM end of the system. The CPM system could also act as a printer buffer, and the CPM keyboard could be used in the place of the Atari keyboard. (ANL 39,103)

SIO2PC

With the demise of CPM and the rise of the IMI cartel (IBM-Microsoft-Intel) a new system similar to the Critical Connection arose. Nick Kennedy developed the SIO2PC hardware and software, which permits any PC with a serial port to act as up to four disk drives for an Atari. It can also act as a printer buffer.

Computer Eyes

Computer Eyes was a video capture system which plugged into two joystick ports. It could render images in a variety of modes. It required a composite video source. (ANL 35, 53)

Easy Scan

Take a cartridge, add a fibre-optic cable, and hook it onto a printer, and you've got Easy-Scan, an image scanner for the Atari 8-bit. Innovative Concepts produced this item. (ANT 7/6, 43)

WIMA Radio, Lima, Ohio

This radio station, when automating 6 broadcast hours daily, created a hardware and software package built around a 130xe for control. Control was via joystick ports and tone decoders. (ANT 8/7, 30)

Comp-U-Temp

This provided 8 or 16 channels and 2 or 4 sensors. It would monitor the temperature, with options to log results to disk or printer, or to sound an alarm if the temperature strayed out of set boundaries. The software was described as "cumbersome". (ANL 48, 35)

Turbo 816

Released by DataQue, this provided a replacement OS as well as a replacement for the 6502 CPU. A 65816 was substituted, providing new opcodes and a 24 bit address space (16Megs vs 64k with the 6502).

Sweet 16

Released by Fine Tooned Engineering, this provides a 65816 CPU to replace the 6502.

MIDIMATE

MIDI stands for Musical Instrument Digital Interface. It is a system for computers to record, replay and control musical instruments. MIDIMATE, when combined with MidiTrack software, permits an Atari 8-bit to take control. (ANL 33, 26)

MicroNet

Supra provided the Atari community with its first networking product. MicroNet provides nine SIO connectors. Eight are for computers. The ninth goes to whatever peripherals are to be connected. The system served to isolate the computers electrically. It did no software checking, meaning that two or more users attempting to print or save at the same time could trash each others output. (ANL 51, 76)

MultiPlexer

CSS provided a better way to network. The Multiplexer system requires one host system which has all the disk drives and printers for the network. The slaves are connected via the cartridge port to the host, and all their disk and printer i/o is rerouted to the host. All the systems involved require their OS replaced with a special multiplexer OS.

MIO

ICD manufactured this wonderboard in 1987. Connected to the PBI or ECI, it provided either 256k or 1Meg of RAM, two RS232 ports, a parallel printer port and a SCSI hard drive port.

MIO II

Currently under development by Fine Tooned Engineering, this PBI/ECI board will provide an interface and power supply for an IDE hard disk. It may also include extended memory support for CPU upgraded computers, as well as a parallel port.

Black Box

CSS manufactures the Black Box, a PBI/ECI device that offers an optional 64k printer buffer. Its main attractions are its m/l monitor, 19200 baud RS232 port, parallel port, and hard disk interface. The parallel and serial ports do not use standard DB9 or DB25 connectors; custom cables are required.

Floppy Board

This is an add-on to the Black Box, also from CSS. It permits standard floppy drives, 360k, 720k, 1.2M and 1.44M, to be attached to the Black Box. Since they are connected to the PBI, these drives operate extremely quickly.

Supra/KP Hard Disk Interface

Supra released one of the first hard drives for the 800xl. It hooked up via the PBI. KP bought the rights to the interface

from Supra.

R-Time 8

This is a clock cartridge for any Atari from Fine Tooned Engineering. It includes a pass-through connector so that any other cartridge can be plugged in as well. Though primarily intended for SpartaDos, software for other DOSes is included.

Mars-8

This is still under development from Fine Tooned Engineering. For 800xls only. Memory expansion of 256k, 1M or 4M. Install internally Action, Basic XL/XE, MAC/65, SpartaDos X, R-Time 8.

Atari 850

This device hooks into the SIO line, and provides 4 9-pin RS232 ports and a 15-pin parallel port. The RS232 ports are NOT IBM PC standard. The MIO and PR Connection use the same pinout.

P:R: Connection

This device plugs into the SIO line, and provides 2 9-pin RS232 ports and a 15-pin parallel port. It is powered by the SIO line. The Atari 1200xl requires an internal modification to work with this device, or with the Atari XM301 300 baud modem.

Voice Box II

Manufactured by the ALIEN Group, this speech synthesizer even nade it into TIME Magazine in their "Machine of the Year" issue in 1982. Plugging into the SIO line, this device would produce speech of the traditional computer variety.

R/128 RAMdisk Printer Buffer Spooler

Protronics of California announced this 128k RAMdisk/printer buffer which interfaced via the joystick ports, offering it as a replacement for the 850. A 512k upgrade was promised. (ANT 2/8, 106)

N1858-32

Newell Industries announced this 850 replacement in 1983. It offered two serial and one parallel port, along with an expandable 8k printer buffer. (ANT 2/8, 106)

Oscar Model 1

This bar-code scanner was from the Databar Corp. The intent was to permit the speedy entry of computer programs which would be encoded in magazines. (ANT 2/8, 107)

1200XL PBI

Hackers love the 1200xl for two reasons: because of all the
space available within the case, and because of the great
keyboard. Bob Woolley came up with this set of plans for adding a
parallel bus interface to the 1200xl.

From: chaos@oo.com
Message-ID: <3i5pu9$25uu@tequesta.gate.net>
Source record: 94221

Greetings folks,

I was wondering if anyone can help me with a small problem. I recently got the 1020 printer/plotter for my atari. As many people know, this is a 40 col printer.

I have gotten TextPro from the umich archives, and found it to be a rather nixe editor, however i cannot seem to find a way to set the output to the printer to be 40 cols. The docs tell me that i must press SELECT and X and then type 40, however when i have done this it only places a little black X on the screen, and thats it. <yes, i have tried it both ways, hlding down select and then pressing x, and also pressing one key and then another.>

Also, if no one can figure this out for me, Does anyone suggest any other editors, word processors for the 8bit? Or if you have a rather nice one can you mail it to me?

thanks,
Ed Heffernan

Boy, Joe you really hit the nail on the head!!! I've had all my 8bit gear backed away until I move into a house, but I can always here a constant murmur from the box its stored in. "Hook me up!!" "You know you want to play Gyruss!"

I'm really excited when I can finally have enough room to hook a couple of 8bit's up, and have my Gateway as their slave through the SIO2PC. (BTW, has anyone tried have two copies of SIO2PC running at the same time, and two 8bits hooked up to it? I don't really see a problem, as long as they are using two different disk images.)

It's been said time and again that there really isn't a more loyal following than those that follow the 8bits.

That Atariwriter was a darn good wordprocessor, speaking as a current
WordPerfect/MS-DOS/Windows user. It was a cartridge in my old Atari 800
and as a touch typist from the days of manual typewriters, I don't
think I will ever find another keyboard as good, although this PS/2
keyboard comes close to as satisfactory.

I haven't had the heart to dispose of the old Atari 800 system. It was
the beginning of my son's successful programming career and I believe
I have every Atari book published packed away. I also have SynFile
and SynCalc - the SynCalc manual was the best explanation of spreadsheets
I have ever seen.

This Usenet conference has been something of a moral booster for having
kept a computer system that everyone was telling me was a dinasaur.
I am going to unpack it all and see what it can still do.

Thanks people,

Margaret Sheremata

Ryan 'Gozar' Collins (rlcolli@ibm.net) wrote:

: Is there a success list for games under PCXF?

This I'd like to see...both under versions 2.5 and 3.0.

As I'm trying to rebuild an 8-bit system after a nine-year hiatus, I'd like to know how much Atari-specific hardware I'll need and how much I can do reliably and with the same "Atari feel" with PC Xformer (again, both 2.5 and 3.0). I'm playing with 2.5 now, and it looks pretty much like the real thing (with a possible bug in the system diagnostic screen).

And as I'm thinking of just getting an 800/800XL and disk drive, how is the sound, modem, printer and joystick support under 3.0, anyone? Are they reliable and authentic or should I consider investing in more Atari hardware?

I read the FAQ and saw lots about ftp sites and BBSes, but does anyone know if there are any places where I can find (public domain) Atari software in .XFD or other format which can be read in PCXformer 2.5/3.0?

I don't have the actual Atari hardware yet, much less SIO2PC, so I need the aforementioned formats if I want to run anything right now.

Thanks!

No doubt, im another one that became an atari junkie. I started
out on my ibm box, and i still use it, i upgrade it regularly, but man,
it was nothing like how i got into the atari..

first time i saw an atari was i was visiting a friends house, and
he had an 800 XE, and one of those 300 baud modems with the built in
software. I asked him, 'whats this' and he just looked at it and shrugged
and said 'nothing, its junk' i said oh. and next thing i knew i was going
home with it.

I was suprised at the support there is for the 8bit still out
there. Since then i have bought an XEGS <wich i personally think is the
best of the 8bit line>, 2 1050 drives, a plotter, sx212 modem ,THAT
wasent easy to get, i tell you> and other nonsense. I also made a bonzia
purchace at a garage sale..got 20 books on programming the atari for 5
bucks. <however i am one of those people who are slow at catching on to
programming...whats wrong with me?> and other junk. Now i find myself
scanning for sale ads, going to flea markets, garage sales, ect. ect all
in hope of finding hardware for my wonderful machine, i, too, am a junkie.

Anyways, it was a bit funny last week, when i saw my friend turn
on his 486 with 8 megs of ram, running windows, microsoft BOB, and

procomm plus for windows, and it must have taken him 3 times the time to go through all that to get to his damn term program in the time it takes me to boot up ICE-T <wich, BTW, i think blows away flicker term any day of the week. how can you STAND that flickering?>

Anyways, you know what i like best about my 8bit? its quiet. no godamn fans. seems all computers these days have to have fans in them, 2 in some with that stupid little 486 cooler fan. My atari sits on my desk in all its quiet splendor.

anyways, not that i would give up my 486, if i had to make the choice, my 8bit would be out the window. but still, its a damn fine little machine..

Ed heffernan, member of the growing AA.

: No doubt, im another one that became an atari junkie. I started
: out on my ibm box, and i still use it, i upgrade it regularly, but man,
: it was nothing like how i got into the atari..

I am not an Atari junkie, I am an 8-bit junkie. I had dozens of 8-bit machines. I started with an Atari 800, I got pissed and threw it at a wall (they say it could withstand a tank, but it couldn't withstand me), then I bought a 65XE with it's notoriously crappy membrane keyboard, guess what happened, the keyboard traces started coming off the plastic, after numerous jumpers and serious headaches I sold it for parts and bought a Commodore 64, that started a learning curve with unplugging stuff while the computer is on, fried my first one because I yanked out the modem from the user port, bought another Commodore 64 and it got hit by lightning, then I purchase a Commodore 128 which still works to this day, after that I bought another Atari 800XL, then two Atari 800's, sold one, then I bought another 800XL, and just recently bought another 800XL (from Thomas Drake) with pre-SuperVideo modification. And of course my numerous PC machines also fit in the timeline there, somewhere. I originally had a Packard Bell 500 with an 8088, then a KLH 195 with a 80286, and just recently bought my 486DX40 which I assembled (wanted to know what I was getting after encountering the KLH with it's all on one board design).

: first time i saw an atari was i was visiting a friends house, and
: he had an 800 XE, and one of those 300 baud modems with the built in

Same here, he had an 800 with 300bps modem, I had his dad get me one, chop chop (right away). What's the difference between an 800XE and a 800 or 800XL? I have heard of these machines before and was interested in them.

Eventually someday I will have those vaporware products like a Commodore 65 an Atari 1450XL, and other vaporware. Would be neat to hack those. I am just starting (since I have so many 800XL's) to decide to start hacking, but need to get some schematics for the 800XL (can someone help?).

: godamn fans. seems all computers these days have to have fans in them, 2
: in some with that stupid little 486 cooler fan. My atari sits on my desk
: in all its quiet splendor.

Mine has three, full tower with dual fans, and a 486 on-chip fan, heh.

: anyways, not that i would give up my 486, if i had to make the
: choice, my 8bit would be out the window. but still, its a damn fine

I agree. I couldn't let go of my 486, but I wouldn't want to get rid of my 8-bit gear either. I am thinking of buying a PowerMac next, the Intel platform is a little ridiculous, the code is bloated, I am in need of a

good RISC based machine, and the PowerMac might be it.

: "this file is not an atari disk file" error message. Try it."
: bjcorr@delphi.com

I believe the sum is only the first two bytes of the file. The other bytes include the disk size (bytes/16 I believe) and some other information. This is readily available in the SIO2PC docs if you care to read them.

1534. Re: Any ftp/BBS site for .XFD format files?

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-19 08:04:58 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3i6u3a$g2s@nic-nac.CSU.net>
Source record: 94232

You don't need XFDs to run PC Xformer, and it's just a waste of space for a FTP site to hold both XFDs and raw files.

Besides, you want to use ATRs, since those work with (and was designed for) SIO2PC and it also works for PC Xformer. XFDs only work on PC Xformer (and also, SIO2PC has other programs like S2PC, AtarImg, DCM2Dsk, etc. (all made by different programmers though) which do NOT work with XFD. The only other programs (that I know of) that work with XFD are ST Xformer (of course) and Disk2XFD (or whatever it is)).

All you need to do to get files into ATRs or XFDs is to install the files in with PC Xformer (on the command line) and then use whatever DOS you're using under Xformer (MyDOS, Atari DOS, SpartaDOS (ahem :))) to copy from one virtual drive (the one where the file is installed) onto another (where an ATR or XFD is installed). Same goes for using SIO2PC and running on a real Atari. Also, of course, there's S2PC and AtarImg to do this under DOS w/o PC Xformer or an Atari.

Good luck!

From: kendrick@zippy.sonoma.edu
Message-ID: <3i6vef$gju@nic-nac.CSU.net>
Source record: 94239

Nice looking FAQ David, but.. for some reason is seems a bit breif and summarized. Also, I feel a "AV" section should be created for things like Parrot, ComputerEyes, Prism Studio, etc. Also, maybe an "IO" section for BBox, MIO/II, etc.! I mean, the last (misc.-ish) section is full of both of those as well as the other oddities (bar code reader, etc.)

Also, are seriously the only two ANTIC-banked programs out there VideoBlitz and Wedge!?

FInally, GameLink wasn't mentioned, nor Transkey or the "8-bit in a PC case" upgrade; and the fact that ICD originally release R-Time-8 and that BEST had a RT8 clone planned was never mentioned.

Just thought I'd stick my nose in it :)

1538. Re: PC Xformer 2.5 under Windows?

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-19 09:53:18 UTC
From: cp576@cleveland.Freenet.Edu
Message-ID: <3i74ee$s2f@usenet.INS.CWRU.Edu>
Source record: 94240

If you have an old game called Neptune's Daughters, load it into
PC XFormer 2.5. Under windows it will bomb and tell you the
programs violated system integrity or says illegal instruction
and recommends shutting down and rebooting.
Without windows it just hangs the system.
It doesn't do it until you move the guy across the screen and
it doesn't bomb on PC Xformer 2.0.
The program doesn't work because of collision detection but
I wonder what it does on 3.0

>
>An excuse to learn more about the limitations of IBM printer
>ports, some of which are true bi-directional, some of which are
>not, and some (older ones) are easily modifiable. (Darn, just
>thought of something else to check out on my desktop 286
>motherboard ... hope it doesn't take long to check)

I do this to transfer files to/from my ST & 8bit ataris. The joysticks
aren't so fast though, so an additional PIA would be _much_ faster.
The transfer is reliable though with my simple checksums and protocol.

When I have finished the software, so that it's user-usable (as opposed
to, just usable by myself), then I'll post it...

Because the joystick ports are so slow though (thanks to Rick Cortese for
the schematic btw for showing me just _why_ they are), the effective
transfer rate is around 300-400cps - a bit better than a 2400bps modem,
but it's better than nothing, and it costs very little (2 joystick connectors,
a DB25, a switch, and some wire).

Richard.

Hmmm. Shocking, stunning, stupifying, and incredible, yes.
Unbelievable, rediculous, frivolous, and nutty, maybe.
But horrifying? Naah. :)

BTW, I notice you have a predominance of 800XL's. I have a similar
predominance of 800's. I wonder if we should conduct a study of this sort
of thing, and see if it correlates with some personality trait. :)
Maybe those who tend to collect more 800's also have a tendency
to like 1970's music,or perhaps those who collect more 800XL's enjoy
bungee jumping. I'm sure we could find lots of interesting correlations.
:)

>procomm plus for windows, and it must have taken him 3 times the time to
>go through all that to get to his damn term program in the time it takes

I noticed this, too. Pc's take quite a bit of time to count
up all their memory when you turn them on, then the drives click and
whir, then a beep!, followed by the autoexec.bat and config.sys loading.
The prompt comes up, then you type WIN, and wait...and wait....finally
the program manager appears. Click twice, wait for your program to load
into RAM.
Or, slip the disk into your 1050, flick the master power switch
on your power strip, and within a few seconds your program is booted
and ready to roll.
Not a difficult choice. :)

>me to boot up ICE-T <wich, BTW, i think blows away flicker term any day
>of the week. how can you STAND that flickering?>

I've never used ICE-T, so I can't comment on that. But, I do
use FlickerTerm and thought perhaps I could offer some advice to users
of that program: go into the OPTION-T window, and set the screen color
to black, the screen luma to darkest dark, and the text luma to the lowest
setting of white you can actually see. The flicker disappears, so long
as you do not have a light shining on your screen.
It works for me, anyway.

> Anyways, you know what i like best about my 8bit? its quiet. no
>godamn fans. seems all computers these days have to have fans in them, 2

Hi folks - I was cleaning out some things yesterday and found some extra copies of Atari items I thought some of you might want. All I ask is that you pay for shipping. It'd be a shame to throw this stuff away...

* License plate frame, which reads: "I'd rather be playing ATARI GAMES" (For the junkie who's not ashamed to admit it, and does so proudly.)

* California Games for the Lynx. Includes manual. Need an extra??

* Adaptec ACB-4000 series user's manual. Excellent technical guide for the SCSI controller many people use when hooking up a hard drive to their 8bit.

* Current Notes magazines: Vol. 11, No. 5 -> Vol. 12, No. 5, Vol. 12, No. 8

Let me now soon...

Oscar

If you haven't had Rev A lock up on you, you're either lucky or
haven't used it much. :) Back in the early days, I recall it locking
up on me many times, always when it was MOST inconvenient for it to do
so.
Happily, this gave me the good habit of backing everything up
frequently, which has served me well for a long, long time on many
platforms. :)
But you are right, Rev. B. had worse bugs than Rev. A.

1551. 800XL flavors

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-19 20:14:36 UTC
From: cmwagner@gate.net
Message-ID: <3i88rc$ren@tequesta.gate.net>
Source record: 94237

I have three 800XL, they are as follows:

1 brown FCC label with FCC ID of BPA7YJ800 above that it says ATARI 800XL,
has a square PBI cover, no notches (the other two do), the RF shielding
is not screwed, it is twisted metal tabs, Made in Hong Kong, ATARI 800XL
nameplate has ATARI in bold, keyboard shows arrows as inverted, not boxed
2 white FCC label with FCC ID of BPA72R800XL above that it says ATARI 800XL,
has a PBI cover with a notch on each end (guess making it easier to remove
with a flatheads screwdriver), the RF shielding is screwed with awfully
large screws causing the monitor DIN to almost not align with the case,
Made in Taiwan, ATARI 800XL nameplate has ATARI in bold, keyboard shows
arrows as inverted, not boxed.

Does anyone know what the main difference between these two machines are
(two of them have the white FCC labels), other than they were manufactured
in different countries and have a few cosmetic differences? And why does
the white label specifically have 800XL at the end of the FCC ID while
the brown label only has 800 at the end of the FCC ID?

So far the only thing that I can personally relate to A. Heller is the
fact that I am also on a Video Game craze, buying cartridges left and
right. Going to have 95 cartridges for the 2600/7800 by the end of next
week, already have 50. And I also have more 800XL's then any other Atari,
even though it is only three 800XL's compared to 1 800. :)

(Talk of BASIC B being bad and how fast it is to boot up DOS and
BobTerm.)
It takes a looooooong time to boot DOS and run BobTerm, although not as
long as the Intel boot sequence described. But, feeling superior, I
must mention my MIO ramdisk. I can boot DOS and run BobTerm in less
than 10 seconds.
As for the best BASIC for our 8-bits. I would submit that I have
probably spent more time working in BASIC than anyone I am aware of,
including Tom Hunt (who graduated to M65 early). I remember comparing
A, B and C once and determined that B is a few bytes changed here and
there from A and C is a recompile. Anyway I use B, that's right B, it
hangs at the 'most inoportune' times less than A or C. It does add the
16 bytes every save, so I do a LIST, NEW, ENTER every now and then.
There's also a bug where a LISTED file won't ENTER. I found that by
entering 0 REM, ie. having a BASIC program in memory, before ENTERING,
you can often retrieve an unENTERable file. I even wrote a program to
retrieve an unLOADable BASIC file. But SERIOUSLY, if you want to do
some extensive programming, I recommend B, C hangs on me 'at the most
inoportune' times, so does A. I believe B to be the best.

My very foggy mind remembers that the bug had something to do with
your program being an exact mulitple of 256 bytes (or was it
128?). I don't recall the exact problem, whether it forgot to
save the last bit of the program or what, but one would not see it
terribly often.

Wait ... you mean some people turn off their computers???

Must be from working in a 24 hour a day environment, but I _never_
turn off any of my personal computers with hard drives ... though
I do suggest that other people do so if they only use their computer
occasionally. Half of our hardware problems at work come right
after a shutdown over vacation or some such time (or it seems like
half anyways).

Bill: in Rev B, BASIC apends 16 garbage bytes every time you save. It's possible to run out of memory, if a program is under development and saved many times. I always LIST, NEW, ENTER and finally SAVE the final version of any program I write on the 800xl. Once my Eprom burner decides to burn the first 512 bytes of Eproms again I'm going to duplicate - FOR MY OWN ARCHIVAL USE - my 130xe's BASIC C and use it instead. Since I only use one machine at a time, no problem.

Dave

1561. Commodore 1902A Monitor for Atari?

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-20 04:21:27 UTC
From: joneil@infi.net
Message-ID: <3i95c7$1bk@lucy.infi.net>
Source record: 94264

I've located a Commodore 1902A monitor I'd like to use with
my Atari computers (400/800). I'd like to know if anyone else
is using this monitor with good results. I checked out the
inputs on this unit and I found a video in(RCA), an audio
in(RCA) and a 5 pin connector for the Commodore 128D it
is connected to. Is the 5 pin input compatible with the
800 monitor out or will I have to make up a cable for this?
And if I'm using my 400 how do I get audio with the separate
video and audio inputs?

Thanks!
John P. O'Neil

Okay, if we're gonna throw on the poor guy;

What about the mod to let your 8-bit control apliances via some Radio Shack
remote control modules?

Does the armitron (Radio Shack robot arm toy interfaced o the joystick
port) hack from Analog qualify?

How about the reset button hack for the CPU from Newell for Omnimon?

Was the Corvus mentioned? I don't remember it in there. HD via the joystick
ports, neat hack.

This FAQ could get rather large. It is a GREAT idea.

Sob!

: What the world needs is a new age.
: What the world doesn't need is New Age.
: except for the fact that my now-favorite-coolest-game is "Line-Up" by "New Age"
: Now, are you talking about them, or just new age music? hmmm

I'm talking about the whole New Age paraphenalia- it's just such a load of old bullshit, there's nothing new about it for a start, it's a load of twaddle wrapped up in mystical nothingness. Typical New Ager- someone who hugs trees. Lets face it, only a sad, stupid person with nothing better to do than this when they escape from their boring job would do this. Respect for nature does not entail indecently assaulting trees.

The world does need a "new age", but not in the above twee sense. It's just a feeling that whatever path we're moving down isn't the right one. This isn't anti-technology, it's more anti everything that's wrong with human attitudes. Technology is a servant, not a master, it all depends on who you let control it however. New Age mysticism seems to be anti-technology full stop, because it's too stupid to see the bigger problem.
It's nothing to do with Computer games companies- honestly.....!

Oh, BTW, please look at my other post in this group
regarding my new WWW pages. Thanks!

What the world needs is a new age.
What the world doesn't need is New Age.

(Bill K. is looking for children's software and Andrew H.
wants to know what I've been smoking and why don't I share
my unLOADable salvager program.)
Bill, psssst.... I got grandchildren. They were on a kick
with Pacman and Elevator Repairman for a while. Sometimes
they play 'Cat in the Hat, Mix up puzzles' and 'Grandma's
House' and 'Tink's Adventure' and 'Tinka's (something'.
Well, here I go again, American Technavision has these and
lots of others pretty darned cheap.
Mr. Heller, I dug out my 'SALVAGE1.BAS' and it is definitely
not in the 'release' stage. I wrote it to retrieve a SAVEed
BASIC file I could retrieve no other way. I'm not going to
work on it and make it 'releaseable', but if you want it 'as
is' leave me e-mail. It DOES work, it makes a LISTed file
out of the bad LOAD file. The LISTed file may need editing
afterwards with a text editor. It is extreeeeemly slow. But
you are welcome to it, not for distribution. Definitely a
'in the works' program I never finalized.
And, you are correct, I smoke way to much, but not that
modern stuff, just the old timey tobacco.
BASIC C is for people who don't work long in a BASIC
environment. I used all three and went back to B because I
really feel B will screw up 'at the most inoportune time'
the least.

Ben, your Corvus is attached to JS 3-4 right? The reason is they are not electrically identical to 1-2. 3-4 actually have transistors in the oupput Whoops! Output, stage so they can work a little faster/harder. 1-2 are passive pull up devices. They have the equivalent of a 10k resistor attached to the 5V supply with a single transistor that either shorts the thing to ground or allows it to put 5V on the output pin. They did this because a logic 1 for CMOS is at least 1/2 the supply voltage while ttl will accept something like 1.2V. This made JS 1&2 (actually the PIA chip itself) CMOS compatable with almost no drive capability, JS 3-4 ttl compatible. Probably one of the reasons JS 3-4 were used for bank switching.

```

This auction contains: Atari 2600 systems and carts, 5200 carts
Intellivision systems, carts, misc
Commodore 64/128 Hardware
ColecoVision system
Atari 800 system
TI994/A Systems
TRS-80 CoCo2 system

This is not a "NewsGroup Auction." E-mail ME bids, not the list.
I have the following items available for sale to the highest bidder.
As always, please read the information at the bottom of the item
listing for information on bidding. Min/
Min Current
Description Incr Bidder Bid
01 Intellivision II w/ Intellivoice! (see below) $2 $2o.oo
02 Intellivision II case/button/screws- great shape! $.5o $ 3.oo
03 Intellivision II system board - AS IS - parts $.5o $ 2.oo
04 INTV Advanced Dungeons and Dragons cart $.5o $ 2.oo
05 INTV Bump 'n' Jump w/box/overlay/instructions $.5o $ 3.oo
06 INTV Bump 'n' Jump cartridge $.5o $ 2.oo

07 TI/994A system w/voice! (see below for specs) $2 $2o.oo
08 TI/994A system (see below for specs) $1 $12.oo

09 Commodore 1541 disk drive w/PS & i/o cable $1 $1o.oo
10 Commodore 1541-II disk drive w/PS (see below) $1 $1o.oo
11 Commodore 128 system unit w/floppy (see below) $1 $1o.oo

---
01 Intellivision II system
Intellivoice Module
2 _completely_working_ controllers!!!
Power Supply
R/F cable
PBA Bowling cart w/box & instructions
PGA Golf cart
All working, very good condition.
INTV II RF box problem (as always!)
07 TI 99/4a system (black/silver)
Voice Module
Power Supply/RF
1 set of 2 joysticks
1 game cartridge
2 keyboard overlays
All working, very good condition
08 TI 99/4a system (black/silver)
Power supply
R/F switch
Keyboard overlay - all working, good condition

10 Commodore 1541-II drive - front drive latch is missing,
looks like it was just pulled off, should be able to find
replacement, but I just use needlenose. Works great, great shape!
11 Commodore 128 system unit w/build-in floppy.
I don't own a PS, so I can't test. Sold AS IS.
Unit is very clean, and in good shape.
NOTE: I haven't "fried" unit by testing other power sources.
13 Commodore 64-like unit

Has a keyboard like a C=64, but it's got a white case. It's a bit
deeper than the 64. There are no Commodore stickers on this anywhere!
I know it's a Commodore because of the Commodore key in lower left.
This is the keyboard unit only. All other jacks are the same as a 64.
I have no power supply with this, and I don't want to try any power
supplies on this, as I may fry it. This unit is untested, and sold
AS IS. The only label on this indicates it was made in Australia.

15 ColecoVision console - Has intermittant problems, but I can play it
if I clean carts real well... may need to be cleaned, AS IS.
Console only.

16 Atari 2600 system (4 switch console)
2 joysticks, 1 set of paddles
Power Supply
R/F switch
Pac-Man, Combat, Defender, Missile Command
All my 2600's are PRISTINE! Ask around!
Tested and working- 30 Day Guarantee
17 Atari 2600 system #2 (4 switch console)
1 Atari Joystick
Power Supply
Pac-Man, Berzerk, Combat game cartridges.
All my 2600's are PRISTINE! Ask around!
Tested and working- 30 Day Guarantee
18 Atari 2600 Console only (4 switch model)
All my 2600's are PRISTINE! Ask around!
Tested and working- 30 Day Guarantee
19 Atari 800 system
Keyboard is missing space bar.
Unit works great, plays carts wonderfully!
Includes Pac-Man cartridge.

O BIDDING NOTES
o All items are marked with a starting bid.
o Any item with a blank "bidder" column has not been bid on.
o Minimum bid increment on cartridges is $.50 if the cartridge
is marked $.50 in the "minimum increment" column.
o Minimum bid increment on cartridges is $1 if the cartridge
is marked $1 in the "minimum increment" column.
o As a general rule, the minimum increment on any systems is $3, but
again- please check the "minimum increment" column for the item.
o If it makes life easier, use the item number listed in the left
hand column when bidding. That way, I can distinguish between
duplicate items that are being auctioned.

O SHIPPING NOTES
o Bidders will pay shipping.
o Bid DOES NOT INCLUDE SHIPPING!
o Cartridges are generally inexpensive to ship, and systems are

usually inexpensive as well.
o I will not quote shipping charges here, since shipping charges
will vary based on your location. However, I will let you
chose which shipping method you prefer.

o The only thing that will not vary in shipping is this- I will not ship
items until I have a money order or personal check in hand for the cost
of the item PLUS SHIPPING. If you feel uncomfortable with this, please
do not bid. I feel uncomfortable about sending items out, and
potentially losing the item, and eating shipping. ;P
The exception, of course, is individuals I have frequently dealt with
in the past.

Please E-mail me all bids (longjon@clark.net)

Thanks!

I don't have the Textpro docs handy (just moved into a new apartment and my Atari isn't unpacked yet), but pressing SELECT and a letter is the way to insert formatting commands into the text. I would think it might be SELECT r for right margin, but I could be wrong. Put it at the beginning of the file.

You would need to do a little rewiring to get video OR audio from a 400.
It might work if you just wired a connector to the RF modulator inputs.

: A friend and I are in the design stage for an atari joystick port to PC
: serial port transfer - any help offered would be welcome - I am still
: looking for information on the DCM format.

If I were you then I would use the existing SIO2PC interface, add a command line to the sucker and then write software so you could directly access disk drives, but the only question is (I haven't looked at the schematics) will this (it probably will) thing have problems hooking into a computer.

It will because the computer also has the command line. That is one idea.

What exactly do you want to do with this software? I think you could use the SIO2PC design and adapt it to your needs. Like the SIO2PC could be a network server (the PC), then write software that from the server by sending certain commands over the bus will allow the server to do certain things. Remote software (Atari) would be necessary, but that is not unusual for the Atari. But what I can tell, all you really want is something like SIO2PC, and with a MAX232, and a few resistors, capacitors, and other basic components you can build it.

1589. Re: Any ftp/BBS site for .XFD format files?

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-20 20:20:10 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <133270@cup.portal.com>
Source record: 94279

Quick note, you don't need the sio2pc cable to use the software for creating .ATR images. It also has at least two ways of getting MS DOS files into an .ATR image. Once you have the files in this format, just write them out to disk & they should be usable.

1590. CMC_Demo's music

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-20 20:38:52 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3iauks$d72@nic-nac.CSU.net>
Source record: 94160

I got ahold of the CMC_Demo (the "Volume Demo") from the archives and am interested in where the music was obtained.

It looks like (just like HTT's "Big Demo" is) it's a collection of music stolen from games. Is this true? Where can one get these games?

The titles listed are:

Adax
Bank
Captain Gather (cool music)
Cedyn
Dagobar
Darkness Hour (very cool music; Id like to get this if it's a game)
Digi Duck
Drutt (Robocop the Series music!? :))
Duch
Gallahad
Guard
Helix (just SOUNDS like a puzzle game's name!)
Inspektor
Jet Action (just HAS to be a game!!)
Loriens Tomb (I think I've seen it mentioned elsewhere; as a game!)
Major Bronx (related to Captain Gather? Just kidding)
Missile Action (related to Jet Action?! :))
Monty Demo
Muff
Najemnik
Problem Jasia (tons of musics; many sound like "level complete"'s)
Reverse
That Demo
Thinker
U[235
Vickey
Zepi
Zdzisio

Can anyone help me get ahold of the games / demos (since "Demo" is mentioned twice in the titles; you know, one assumes things :)) !?

I'm quite interested in Darkness Hour for some reason; what is it about? Anything like Castlevania for the Nintendo (and arcade (I think))??

Thanx!

-bill Oh, and BeweSoft make this? A lot of his/their demos were put up at Umich at the same time

Hmmm.. Analog magazine ripped that one apart, saying that it doesn't even fulfil even *one* promise on the game package - even the two game screens pictured never made it into the game! The review said it was a horrible game (I'm tired, I don't feel like writing any more). To put it short - is it really that good!

Oh yeah, I tried hacking Joust! I managed to change the screen colors so the nests don't appear green on my computer. I also managed to, accidently, wipe out the lower platform, so the game has no floor! Much more fun to play, really! If anyone's interested I don't CARE! (but you can reply if you really want to know how)

1597. Constraints improve art

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-21 02:19:27 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <hg7bUvP.ransom22@delphi.com>
Source record: 94285

I was listening to National Public Radio's (NPR) "All things considered"
news program this evening, and heard an interesting little segment.
The subject was the man who had translated a French novel into
English. The novel was writtenin 1969. I believe the english title
was "A Void" or "Avoid", I'm not sure which since this was on the
radio. :)
(I know, but this really does relate to Atari...just wait!)
So far it sounds pretty boring, yes? Well, the catch is that
the original was written in French (as stated before), but using only
words that do not have an "e" in them! As in English, the E is the
most frequently used letter. The translator used this same method in
the English version.
the question that comes to mind is, "Why in the world would
anyone restrict themselves like that?" (See where I am going now? :))
The original author decided to use only words that do not have
E's in them because he felt that he needed some restriction in order
to boost his imagination. He noted that formats such as sonnets and
others that have definite guidelines yield the most beautiful,
imaginative work. He felt that the novel, having access to the entire
modern French language (or any other language), was completely
unrestricted. So, he laid down a pretty tough restriction on himself,
and produced a work that is of high quality and wonderful imagination.

Why do I mention this here? Well, I (being of the 8-bit
community) often get the same sort of response as the author did:
"Why are you restricting yourself like that?" Now I can give them
a good, accurate answer. In restricting ourselves (I'm talking about
programmers here) to the 8-bit Atari, we are helping ourselves to
produce works of higher artistic value, and we are pushing ourselves
harder than those who indulge in the full, unfettered worlds of the
current crop of microcomputers (with megabytes of RAM, hundreds of
megabytes of disk space, horrendous speed, etc.). Those that program
on the IBM, Mac, etc. platforms do not need to push themselves. THey
can solve all problems with brute force and the user will be none
the wiser. On the other hand, we must constantly push ourselves,
compacting our code and making it as terse as possible.
In short, we 8-bitters must go about our work much more
imaginatively. Just like the author of the book cited above.

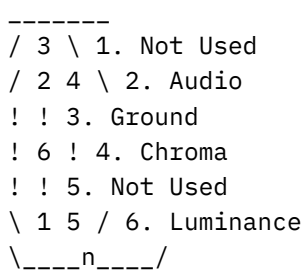
In a message dated 2-20-95, John O'Neil said:

"I've located a Commodore 1902A monitor I'd like to use with
my Atari computers (400/800). I'd like to know if anyone else
is using this monitor with good results."

Not a 1902A, but I have used an Amiga 1080 with terrific results.
I expect you should have no problems at all. Not only that, but if
you have or decide to get a XEP-80, you can modify it for TTL level
output and use the RGBI mode for 80 columns, so that you would not
need a second monitor.

"I checked out the inputs on this unit and I found a video
in(RCA), an audio in(RCA) and a 5 pin connector for the
Commodore 128D it is connected to. Is the 5 pin input
compatible with the 800 monitor out or will I have to make
up a cable for this?"

Actually, if you check closely, you should find that a 6-pin DIN,
not a 5-pin (on the 1902A). Over in comp.sys.cbm, someone recently
posted the pinout after successfully making a replacement for their
missing cable. The pinout is as follows:



1902A

```
(Itay has a 40 meg hard drive.)
Sounds like a RLL hard drive. You need an MIO or Black Box, with the
MIO you would need an Adaptec 4000(?) (A I think) SCSI to RLL
controller, probably need the same thing with the BB. Now FTe or CSS
could probably sell you something, but you're talking probably $300 or
more. Maybe somebody wants to sell a MIO (never heard of anyone except
that guy from Alaska selling a BB).

Jeez! Just ask Clay and he'll do it! He's the master of bells &
whistles. Anywho, you could use the h,j,k,l keys to move the cursor also.
This was provided for those who don't have real cursor keys at all. (PET?
8088? I dunno).

I finally got a proper handler for use with Ice-T! It works, but it
isn't really true ansi like FT80. And the download feature is shaky, but
seems to work. Other than that, it's ok. But the author is DEMANDING a
shareware fee payment while Clay requests a postcard from the users to
just say "Hey!" I say keep FT80 and send him some "Hay" along with the
"Hey!" He'll appreciate it. It might entice him to finish this project.
(Hint, hint).

1602. [?] Atari 8bit Logo cartridge docs, or maybe a list of keywords

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-21 04:53:37 UTC
From: galt@asylum.cs.utah.edu
Message-ID: <3ibrkh$ccj@magus.cs.utah.edu>
Source record: 94161
Cross-posted to: comp.sys.atari.8bit,comp.lang.logo

I picked up a logo cartridge recently for 50 cents, but I have no docs. I have guessed a bunch of commands from last time I used logo (15 years ago or so), but there are still things I'm confused about... Can someone point me to a FAQ somewhere or maybe email me a list of the keywords (I can probably figure out how to make things work). I'd really appreciate any help... If someone has the actual manual, I'd love to get a xeroxed copy...

Some of the things I've been wondering about: changing the color, using the full screen instead of the top 4/5, changing resolution, joystick or keyboard sampling, how to use the editor

I'd also appreciate a pointer to a faq that lists generic logo commands for any system.

Thanks.

Greg

Source record: 94299

Question: which way have you broken through the 16MB barrier for the one
partition? There is up to 9 drives allowed, isn't there? There may be
up to 65535 sectors on each; the maximum sector length is 256 bytes.
If we use all allowed drives as hard drive partitions (what about floppies?),
we cannot use a disk bigger than 144 MB (9 drives * 16 MB on each). Which
way you can use a 300 MB drive without writing a completely new DOS?

I think it is worth mentioning more clearly, for the less hardware-wise readers, that these transistors are the driver transistors internal to the 6520 chip. The 6520 has two halves, more or less, the A half with the pseudo-resistive pullups, and the B half with active transistor pullups.

One thing I think is worth pointing out is that the 6520 and the 6820 are (more or less) identical parts, and the 6820 was later upgraded by Motorola to the 6821, which has identical A and B halves, both with the active pull-ups. If one were using the 1 and 2 joysticks for output usage, one might want to consider swapping the 6520 with a 6821B (though a 6821 might be fast enough), particularly if you have one of the Ataris with socketed chips.

Another possible speedup would be to consider that the 6520 was designed to drive one standard TTL load, while most loads these days are LSTTL. The differnece is in the current sinking required to drive an input low, being 1.6 mA for TTL, and about .4 mA for LSTTL. The 6520 will sink 1.6 mA. IF the load you are driving is one LSTTL gate equivalent, then you could add a (4.6v/1.2m) 3.9 K pullup resistor to the lines. This should cut the rise time to about a third of what it was, assuming the 10K figure in the quoted post is the only pullup. One can get a rough idea of the input current requirements of an input by connecting the input to ground thru an milli-ammmeter.

All that being true, let's look at a typical possibility. Suppose one wanted to drive an IBM printer port. Looking at the print for the original, we see that the 4 lines _known_ to be available for bidirectional output/input are the status line, with open collector outputs, a 4.7 K pullup resistor, and an LS240 input. Thus, no extra

resistor should be added in this case, or the drive capability of the specification could be exceeded. In fact, if we take into account the 100 ohm resistor in series with the line in the Atari for RF suppression, we are slightly exceeding the specified .4 V drive at the input, if the 6520 just barely met it's spec. But then, the LS240 input current is only .2 mA for at a low input voltage.

But now, if the printer port is modified for true bi-directionality (which is easy on the oldest IBM style hardware, but has to be designed into todays hardware), The data i/o lines are driven from an LS374 output, and read back by an LS244 input, as well as having a .0022 uF capacitors (the Atari has capacitors on the joystick lines as well, though I don't have the print handy)

The 5 input only lines have no pullup resistor, and hence may benefit from a pullup resistor in the 3.9-4.7 K range.

A rise time analysis with say .004 uF of capacitance, and 4 K equivalent pullups would give a 35 uS rise time, and probably an equivalent fall time, given the drive capabilities of the 6520. Thus, 70 uS per cycle, or maybe 14,000 cycles per second, may be possible. If one is transfering 4 bits at a time, this could give a thruput rate of the order of 5000 bytes per second maximum, allowing for processing time.

I am wondering about the post with the thruput of the order of 300 bytes per second, whether that was a bit banging serial output. That would be a clocking rate of 3000 cycles or so, reasonable for a 6520 with no external pullups on such a capacitave load.

As my other post on this thread mentioned with all kinds of bloody
details, a lot depends on what one is driving, and the capacitance
of the cable hooking the two devices together.

MOS style inputs, such as on the Atari joystick port if used as
input, do not take a great deal of the drive current for the input
to the device, leaving more available for the capacitance. Also
possible is the difference between the A and B ports on the PIA,
if you were driving thru joysticks 3 and 4 you had a lot more
drive current available.

>from the PC side.

You simply want to build a hardware XL emulator for PC. But I've got such a emulator yet; it is 100 % XL compatible and needn't any PC to run. It is my 65XE. So I would like rather to expand my Atari, than to buy a PC to expand such as emulator, because this looks much more expensive. What do you think, how many Ataris can you buy in Poland for a good PC? 30. So, I've got two computers yet, and I needn't any third.

>The second alternative is a dual port RAM setup which would allow
>the Atari and the PC to have a relatively high speed
>communications channel, sort of a super speed SIO2PC with it's own
>protocol.

<many lines removed>

Something like "PIO2PC", you mean? It have been done yet and I'll try to upload all necessary files to MERIT. It uses the PC as a hard drive, but there is no point to no expand the handlers then use the PC as a screen or, for example, a printer, real time clock etc.

Atari is connected to PC slot through relatively simply interace inserted into ECI. It uses 10 lines (except ground etc.):

1) 8 data bits
2) 2 unidirectional acknowledgements (signal: byte received)

It has its own new-device handler residing in D800-DFFF area. All (ie three) registers are on page D1. To communicate with the PC my handler uses a SIO-type protocol:

1) XL command ---> PC
2) XL <--- PC "command successful"
3) XL data transfer <---> PC
4) XL <--- PC "data transfer successful"

Acknowledgement lines are automatically set and cleared, when a byte is received. In fact, Atari inserts a byte to the I/O port then waits until

PC will receive it, then inserts next byte, then waits etc.

PC handler has been written in Turbo Pascal. The Atari partitions are in fact the MS-DOS files. Originally, during reading/writing a file from Atari to the virtual partition, the data transfer reached about 20 kilobytes per second (with the 386DX/40MHz) and was limited by... PC. Now my friend has corrected the PC handler, so the data transfer reaches about 30 kilobytes per second (with the same PC). Speed is limited by Atari and there is no way to make it faster, because XL has really fast and versatile handler. So I doubt, that 50 kilobytes per second will be really possible, unless we will accelerate the XL or make DMA for hard drive.

I haven't checked out every 800xl I've seen, but in general it seems like serial number is more important. For instance, if it's below 50,000 then it has everything but the OS & Basic ROM socketed so it's easier to upgrade. Downside=> it probably has a Stackpole Keyboard which are kind of mushy & revision B basic which a lot of people have problems with. Serial numbers from 100k-200k seem to have Alps Keyboards which I prefer, but the memory chips are soldered in making memory upgrades a pain. I've heard some of the later 800XLs had revision C basic, but I've not verified that myself. It's been my experience that the labels are the last thing to go on a product so apart from serial numbers, labels won't necessarily tell you that much. What happens is the manufacturer <Atari for instance> may go to several different suppliers for sub assemblies<Alps & Stackpole for keyboards for instance>. Maybe someone else for cases, dram, custom silicon, PC boards, connectors. They then use the stuff as it comes in & keep some kind of record on what went into which computer, stuff like; Stackpole keyboards were used in serial numbers 0-56,222 computers. Revision B Basic went into 0-222,222 computers. New order of Stackpole keyboards comes in and are used in serial numbers 211,000-244,000. As the computers are finished, the labels get their serial number stamped. Unfortunately, as far as I can tell, an accounting for what serial numbers have what equipment has never been done. I've heard of at least one other keyboard in an 800xl <Mitsumi?>, but I've never owned one myself.

)
No, I can't put my finger on it. I started out with version B in my
first 800xl. It would hand, I would loose the program by a bunch of
numeric gibberish taking the place of code if I LISTed, my first large
(fairly) project, I lost a big revision because the LISTed file would
not ENTER. Sometimes variables don't 'Take' and you have to change the
variable name. It is just that when I work in version A or C, I get
'stuck' (the system hangs) more often and at worse times, (meaning the
longer you work with SAVEing or LISTing, the more likely a hang will
occur.) I know this is totally unscientific and many will consider it
a matter of misguided opinion. But I have spent 100s of hours doing
things in Atari BASIC and am really convinced of the correctness of
what I am saying (B hangs less and less anoyingly than A or C.)

For any command, you merely have to append the desired output device.
So, LIST [RET] sends the listing to the default device (the screen E:ditor).
LIST "C:" lists to the cassette, LIST "D:FILENAME.EXT" lists to the disk file
and LIST "P:" lists to the printer.

The Atari OS is arguably the best designed OS on an 8-bit platform, with
factors like central i/o so that calls to any device are treated identically,
making for much easier re-routing of i/o.

By swapping 16meg aprtitions in and out you can use a hard disk of over 144Meg.
This is cheating, I'll admit, but it's good enough.

The PEEK for rev C BASIC is

? PEEK(43234)

If a value fo 234 is returned you have version C, 96 is B and any
other number is version A, but that was never installed on an XL.

Does anybody know of a simple peek to tell whether you have
a 130XE or an 800XL on line, without having to actually do some
bank switching?

>a 6520 with no external pullups on such a capacitave load.

I'm connecting my ST to my 130XE and transferring data via the parallel
port & the joystick ports 1&2 (i.e. port A of the PIA).

I timed via a stop watch, so it might not be the fastest transfer - I can't
say which end is the slower, but the ST port is supposed to be at least 3K/s
isn't it? So I figured that it was the 8bit letting it down.

I also send each byte 3 times, with only 7bits for the data, and the 8th bit
is for a strobe. I found that this was the most reliable transfer rate.
So therefore, you could say it was around 900cps - but an unreliable 900cps.

I am perfectly willing to share what I've done, just as soon as I have
finished making it a bit more presentable. It probably isn't the best way
of transferring data, but it's the only way _I_ can transfer files at the
moment. Oh, and it works...

I have the following extra 8bit hardware for sale or trade:

4 x stock Atari 800xl CPU's w/power and IO cable
4 x stock Atari 1050 disk drives w/power and IO cable
2 x stock Atari 1200xl CPU's w/power and IO cable
2 x stock Atari 800 CPU's w/power and IO cable
2 x Indus GT disk drives w/power and IO cable
1 x RARE TRAK AT-D4 360k disk drive w/slave and printer port (in box)
2 x stock Atari 65xe CPU's w/power and IO cable
2 x Atari 1025 nlq printers w/power and IO cable
2 x ICD (FTE) PR:C devices w/extra IO cable
3 slave CSS Multiplexor w/60 foot cable and all docs, disks, etc..
2 x Atari SX212 direct connect 1200baud modems
2 x Atari XEP80 80 column devices
5 x MIO preformatted Seagate ST225 20meg half height HD's
2 x MIO preformatted Seagate ST251 40meg half height HD's

Trades Wanted:

* Adaptec 4000a controller cards
* 20+meg SCSI hard disks
* tape backup system (Colorodo?) for PC w/software
* CD Rom (2x spin) for PC w/software
* 2 line phone (NO CORDLESS!)
Star NX-1000 NLQ printer
* Canon Bubble jet printer
* AD&D books/modules/accessories
* Upgraded 800xl (256k +)

Make reasonable cash or trade offers on anything listed above..

kendrick@zippy.sonoma.edu (William Kendrick) writes:
>Does Atari logo support all of the "other" commands?!

8-bit Atari Logo was a brilliant piece of programming, fitting
just about everything into 16K of ROM cartridge.

There were a few compromises. Some primitives that ordinarily have long
names and abbreviations had only the abbreviation, so you had to type
CS, not CLEARSCREEN, for example. Some of the more advanced programming
aids are missing (CATCH, THROW, PAUSE, DEFINE, TEXT, TRACE, etc).

On the other hand, it has all the list processing stuff (FIRST and BUTFIRST
and all those), and it was the first Logo with the ability to set up a
"demon" that would carry out a given set of instructions when a certain
condition was met. (The Atari Logo demons were mainly about turtle
collisions and joystick buttons.) In a sense it was the first glimmer of
the ideas in Microworlds.

Source record: 94190

In a message dated 2-20-95, Itay Chamiel said:

"I just got a 40-meg hard disk, and I wanted to use it with
my Atari..The connections on the back look like this:
Edge connector, 10 each side. Another edge connector, this
one 17 pins per side. and a female connector,..."

You've just described an old ST-506 interface hard disk. It is neither
SCSI nor IDE.

"What hardware can connect this to my XE?"

You would need an Adaptec card (which allows ST-506 interface drives
to be connected to SCSI), and a SCSI controller, such as the MIO
or Black Box. Unless you get a very good deal on the Adaptec, and
already have an MIO, or get a very good deal on it as well, you
could just about buy a MIO-II and a newer, more reliable, IDE drive.

1643. 256K MIO & 320K 130XE for 800XL?

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-22 08:20:33 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <Ro2ZkBZ.lmcclure@delphi.com>
Source record: 94193

Since I would like to have an 800XL for greatest compatbility with most upgrades (including possibly the MARS 8), I have in the past offered to trade my 320K 130XE for an 800XL, with a suprising lack of success. (I thought I had a deal, but after many months, that person never contacted me again).

I am thinking of sweetening the deal by throwing in my 256K MIO (since I will likely be getting an MIO-II). However, for this, I think I would have to get one heck of an 800XL.

A unit with any extras, such as the Supervideo 2.1XL upgrade and audio upgrades already installed would be a plus, as would a RAMBO or Newell 256K upgrade to tide me over until I got a MARS 8.

The only caveat is that the 130XE needs work on the function keys, and because of that problem, I have not been able to fully test the MIO. However, as much of it as I have been able to test without access to the config menu does appear to work).

If you are interested in this trade, e-mail me with what you have to offer, and I'll mull over my options.

>interested in where the music was obtained.
>
>It looks like (just like HTT's "Big Demo" is) it's a collection of music
>stolen from games. Is this true? Where can one get these games?

The musics you specified have been composed with the "Chaos Music Composer"
(CMC). This program is very popular in Poland, so people often use it to
compose a soundtracks for their games. Most of music you specified have
been really extracted from games, but nobody seems to mind it. In fact,
the musics have been often "published" by their authors after a game is
released. It is considered like a kind of advertisement.

>Can anyone help me get ahold of the games / demos (since "Demo" is mentioned
>twice in the titles; you know, one assumes things :)) !?

>I'm quite interested in Darkness Hour for some reason; what is it about?
>Anything like Castlevania for the Nintendo (and arcade (I think))??

I suppose, that many of titles you specified are still available as commercial
products. Try to write to:

Mirage Software

Man, are you ever lucky to be living in the Santa Clara, San Jose, Sunnyvale area.
I was in San Jose for a week during the last Internet World conference and hit those stores (with Mike of FTE) and was it ever cool. Weird Stuff not only carries hundreds of different computer items (Atari PC's, Atari ST, Atari 8bit, PC, DEC, Mainframes, etc.) but also carries
brand new boxed (discontinued) software for $.50 to $15.00/peice!

You must be practically neighbors with Mike Hohman of FTE...

EH>
EH> thanks,
EH> Ed Heffernan

All that SELECT does in TextPro is to put a character into its ASCII
high, reverse video state. TextPro reads inverse/reverse characters as
assignable "wildcard" bytes. The wildcard character usually has to be
defined first, before it can be used. For example, a common wildcard
assignment is to use [-SELECT-] [-E-] as a "transmit ESCAPE" character.
Thi is done by putting the [-SELECT-] character in column one, and then
giving it an assignment value. E.G.

[-SELECT-] [-E-] = 27 [-RETURN-]

[-SELECT-] [-E-] F [-SELECT-] [-E-] G <-- This turns on DOUBLE
STRIKE, EMPHASIZED, on an
EPSON MX/FX 80/100 for Near Letter Quality.

NOTE: The above is shown in "expanded" format. No spaces should
appear between keystrokes. The figure '[-' '-]' is used to
represent a keycap.

...when TextPro comes across the inverse/reverse "E", it now
substitutes an ESCAPE (decimal 27) character for it into the output stream.

What you are asking is --NOT-- a TextPro question. What you are asking is a --PRINTER-- question! What you need to know is what the table of Control Codes to drive an ATARI 1020 plotter are and, specifically, what the printer Control Code to place the plotter into text output mode is. Once you know that, outputting codes to drive the printer becomes a snap! Unfortunately, I have an EPSON MX, so I am unable to help....

Anybody out there have an ATARI 1020 plotter and a table of control codes?

Depends on what one calls good, but one can pick up old PCs
(limited junkers, more or less) for less than $100 versus a going
price for Atari's of the order of $25 to $35 (aside from flea
market and thrift shop specials at much much less).

The point, however, was not to suggest a cheaper solution, as an
PC board would end up running more, but something cheaper than the
Black Box type product, an alternative with hard drive
performance. Also, I like the idea of getting rid of extra boxes,
get everything in one case (as do those who mount Atari circuit
board in PC cases, along fith the floppies and such.

Perhaps I misunderstand that last, but with screen and keyboard
handlers, one instantly has an 80 column high quality screen, and
whatever keyboard one uses with the IBM PC ... replacements for
screen hardware on the Atari, or the Flicker Term type product,
and the Transkey type product.

Wonderful!!! Please do get your documentation and software up
somewhere for public access!!!

The 50 Kbytes per second is the channel rate ... you probably are
getting that on your setup. As you mention, the limitation is
basically the Atari handling speed per byte, it having to move
each byte twice, once from the port to buffer, and then from
buffer to final destination. Thus, you probably are achieving a
transfer rate of the order of 50K bytes or better, if one hung a
'scope on the data channel.

The advantage of the dual port ram setup would be in this speed
area. It would then be possible to (depending on OS software and
such) only need to transfer the data once in the Atari, ifone
assigned the buffer to be the Atari side of the dual port RAM. It
could potentially (only potentially) lead to close to doubling the
effective transfer rate (the 30 K or so you are seeing).

The ideal setup, which might be do-able with fast enough memory
cycling, would be to have the entire base 64K of the Atari dual
ported into the PC. Like the idea that has been posted here of
having two 6502 processors sharing the same memory, only the PC

would access the non-active half of the memory cycle rather than another 6502.

Geez ... I better shut up or I'll talk myself into wire wrapping something up.

Is this bi-directional? or only from the ST to the Atari? If
bi-directional, I would point out that one of the trigger lines
can be turned the other direction, like the data lines. Designed
to be used for a strobe, can even toggle automatically when data
is written to the port.

Yeah, sorry about the name mistake Mr HACKNEY but I still feel your comments about the 8-bit being dead are wrong!

Sure none of the big software houses create new 8-bit software, and very few shops still sell 8-bit software over the counter but that doesn't mean the format is dead!

Twice a year there is a computer show held in Stafford England, its called AMS (All Micro Show), if you paid a visit to that you would find five or six vendors still selling Atari 8-bit software and hardware, quite a lot of it is NEW stuff, some from continental Europe, some from within the UK and some from elsewhere. About 10,000 people visit the show each time and about 2,000 of these are Atari 8-bit users, by far the largest proportion for any single user base. The Atari stands are always crowded, right throughout the day, much more than the other stands. Somehow I don't think the Atari 8-bit is dead just yet! There is still a hardcore group of users, just as there is in the USA and I'm pretty sure they will agree with me that the 8-bit is not dead (without life - not living) yet!

The statement I gave about Red Rat not being able to find a distributor was published in a Page 6 or Atari User issue around the time Speed Run was released. Yes budget games did swamp the market but there was no real reason why Red Rat couldn't have jumped on the band wagon, Zeppelin launched later than Red Rat and produced some fantastic games. As I said you can still buy software and hardware, check out the Vendors/developers list for details. I recently posted my product range list to the Digest.

Finally, what do you mean why you ask me to point out a game on the 8-bit that is as good as a ST game. In terms of graphical appearance that is quite hard, in terms of playability (which is surely the most important factor) I suggest Star Raiders, M.U.L.E., Zybex, Draconus, need I go on?

Source record: 94187

Here in the UK it is common knowledge that the first thing that goes wrong with a 1010 is the play button breaks. Many people suggested simply taking the 1010 apart and swapping the pause button (no use whatsoever) with the broken play button. I have seen a 1010 that has particularly sturdy buttons, perhaps there were several suppliers for these buttons?!

One of my 800XL keyboards has a PCB for the traces, not the usual plastic things. Is this usual?
I would just confirm that yes later 800XLs do indeed have BASIC rev C installed, well one of my PAL ones does! Don't know about the NTSC ones though.

One would guess PMGraphics.

If the Atari isn't able to have black PMGs show up on a Gr.0/8 screen, then they probably had a black screen covered in huge blue(?) PMGs.

I've never seen AW but in a magazine advertisement. I've got AW+ but never use it (waste of $50 ; got my modem at the same time and found TextPro!).

Oh well, if it were more DOS compatible and I could run it off of SIO2PC I might use it more. I miss the cool scrolling and print preview in TP.

Tim, I can beat that story. At A to Z Wharehouse in S.J. they had palletes of 1010's, new in the box with power supplies, cables, everything for $5. I offered pick one up & ship at cost to anybody & only got a couple of takers. The owner finally got tired of seeing the Atari stuff just sitting there so she said I could have the entire collection of Track Balls, 820 printers, 1010's, etecetera for $150. I told her I couldn't get rid of that much stuff & gave her the B&C number. I think Bruce picked up a lot of it, but not all. I also bought & fixed a bunch of returned 1050's but sold off the better ones for $30 including shipping. Still have about 4 stocker's laying around that work, but not good enough to sell even at what it cost me to buy/fix/ship them. A to Z is no more, ACE on Bascom, another one of my favorite haunts is gone. I happy the new stuff is cheap, things like IDE/Floppy/I/O for $12, but it sure damaged the existing surplus vendors.

>
aHmmm ... I wonder why it was unreliable. I would suspect rinigng
ong the lines, or the strobe pulse is getting to the other end of
the cable before the data pulses. I would suggest slowing things
down, probably by putting a series R, C to ground on the strobe
lines, to slow down the handshaking. This may be a case where
sloer is faster <grin>. But there should be no reason for data
errors, unless noise is being induced from someplace, other than
trying to read the data too quickly. Cabling could be a culprit,
if the strobe pulse is coupling to the other lines and changing
the instantaneous voltage of them. Slowing the strobe would help
this. Making sure the strobe is shielded from the other lines as
much as possible could also help ... if using ribbon cable, use a
few extra lines, and ground the ones adjacent to the strobe.

A possible combination might be a series 220 ohm resistor, and a
.01 uF capacitor, for an added 4.5 uS or so to the rise and fall
times, thus adding about 2 uS delay to the pulse. If using
program to generate the strobes, I would try delaying about 10 uS
or so. The added RC would cut down any ringing somewhat too.
Of course, this can be carried too far, depending on the receiving
logic ... logic frequently needs a rapid enough transition to
avoid the equivalent of contact bounce. The solution is using
schmidt trigger inputs, which are often part of line receiver
chips. But part of the attraction of joystick to printer port

connections is the no circuitry required aspect.

My electronics building skill isn't the greatest, but I do know which end of the soldering iron to hold!!

Anyway, I have a simple question, which way do the capacitors go? I have the axial type, and they have a arrow, but I don't know which way it is to go.

TIA!

It's bi-directional, although you have to flick a switch that goes from the
!BUSY line to ground, else the ST won't do anything (but the program checks
for this first).

Wish you would have told me this a while ago when I asked for help in this
area. Could you please mail/post how to use this trigger line? It would
be _very_ helpful!!! I know the trigger lines go to the GTIA (as I have an
800XL schematic - thanks yet again, Rick Cortese!)

Thanks,
Richard =8-]

> E-Mail: Russ.Gilbert@apk.wariat.org

Heh heh. Yeah...I do need to clean the monitor! I'm not at the Atari
at the moment, but it seems like when doing a SELECT-E (for example), the
"control character" printed is in a little black box for visual
emphasis. Perhaps someone more experienced with AW can answer....I can't
find my AW cart right now.

The question came up when I was reading (pitifully attempting to learn)
about color registers, possible on-screen colors, etc. I distinctly DO
remember seeing these little black inverse-boxed characters on the
screen, though. Then I wondered how they did it in a GR.0 text window.

I'm glad to hear that there are still some shows about - I used to attend the
Atari shows in the 80's.But 2000 people isn't brilliant;twice as many watch
Lincoln City play football,know what I'm saying?

> The statement I gave about Red Rat not being able to find a
> distributor was published in a Page 6 or Atari User issue around the

> fantastic games.

Zeppelin also produced some terrible stuff,remember Fantastic Soccer?I know
about Red Rat's distribution problems;i read the same mags.I also remember all
the fuss about Little Devil which was totally unjustified.Incidently,Hades in
that game was blue on my 130xe for some reason-any ideas?Regarding your
comments about "jumping on a band wagon",there are a lot of financial
considerations which do not allow one to jump upon a band wagon as easily as
you suggest.

> As I said you can still buy software and hardware,
> check out the Vendors/developers list for details. I recently posted
> my product range list to the Digest.

Yeah,did you have a game called Jawbreaker for sale?I seem to remember it being a pac-man clone which came in a bundle with other games like Cannibals. Was it Microdeal who did them?I can't remember off hand.

> Finally, what do you mean why you ask me to point out a game on the
> 8-bit that is as good as a ST game. In terms of graphical appearance
> that is quite hard, in terms of playability (which is surely the most
> important factor) I suggest Star Raiders, M.U.L.E., Zybex, Draconus,
> need I go on?

I said SOFTWARE not games specifically.But I can suggest Doom,Populous,Lemmings,Sensible Soccer,need I go on?I think Zybex had average gameplay,great music ,great graphics.Draconus was superb though I never really enjoyed Star Raiders. My favourites were:

International Karate
Basil The Great Mouse Detective
Decathlon
Goonies
Zorro
Bruce Lee
Donkey Kong series
Spy vs Spy series
Polar Pierre
Ollies Follies
Scooter
Draconus
Popeye
The list is endless(and changes every time i remember another game such as Rebound(great in 2-player).

Cheers,

1668. SIO2PC with SpartaDos

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-23 12:15:34 UTC
From: jeking7@delphi.com
Message-ID: <BO7aMJm.jeking7@delphi.com>
Source record: 94108

Help! Last night, I finally acquired an SIO2PC cable for use between
my MUX based Atari system(s) and my 486DX2/66. Since I already
have 800meg on my Atari(s), I'm curious as to how I can create
a 16meg image on the PC, and FORMAT it in SpartaDos format - then
dump an entire 16meg atari partition over to the PC?

So far, I've only been able to create and format floppy (up to 720k)
sized partitions - as there doesnt appear to be a Spartados based
utility that will format a 16meg partion (except for my MIO stuff, but
it wont work on one of these mirrors).

Any help appreciated.

(J. Wood asks about ATW black boxed Graphics 0 letters.)
Ok, now I see what you're talking about SELECT E and SELECT H
do put a black boxed letter on the screen. ATW was my first
word processor, paid $80 for it. I soon switched to Paper
Clip, so you're right, I haven't used it for years. Very
user friendly. I'm 90% positive the black box letters are
done with a DLI. If you want to play with custom display
lists, I wrote a program to make BASIC lines to make any
custom DL you like. ANALOG had a similar DLI maker, that
had a published bug, but once fixed was fun to experiment
with DLIs with it. If you want one or both, I'll uuencode
and send them to you. I really don't think the black inverse
letters are PMGs. All that is necessary is to change one
color register to make those letters, but my limited knowlege
of DLIs relates to changing a color register for an entire
display line. I don't know how to segment a line like
John Harris does, it requires exquisite timing.

I seem to remember this being kind of tricky. What I had to do was create a custom double density disk with 65535 sectors, and assign it to drive 3 or 4. Then I would use the "HDFORMAT" (I believe that's the name) command to format it. The catch is that sometimes HDFORMAT will not be able to determine how big the partion you just created is. I think I had to create the partition first, and then install my DOS disk image.

If this fails to work for you, I'm pretty sure I have a zipped up 16-meg partition file in storage somewhere (I stashed it just to save myself the time and hassle...)

Let me know if you have any further problems.

I typed in *every* Atari 8-bit related program Compute! ran for a
period of around two years (+/- some issues which I missed), and have
never had BASIC crash. Revision C-equipped 800XL (bought in the UK,
in case that makes a difference). Don't know if revision B crashes
any less than never, but I somehow doubt it ;)

1672. BASIC rev A,B or C?!

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-23 14:52:34 UTC
From: CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK
Message-ID: <122A10F27E5@east-01.novell.leeds.ac.uk>
Source record: 94112

Whats all this about BASIC rev C hanging?

I have a rev C 800XL and I have programmed in BASIC extensively and
it has never (I repeat NEVER) hung on me! Sure I've crashed it by
poking the wrong number in the wrong place but it has never hung
by itself, or due to any keypress.

I did once buy a 130XE that would lock up after pressing the return
key 3 or 4 times. I checked and it had rev C BASIC. I tried it using
Turbo BASIC and it worked perfectly so I came to the conclusion it had
a faulty BASIC ROM. It was still under guarantee (in warranty) and so
i returned it to where I bought it from. They said there was nothing
wrong with it, I insisted there was and in the end they did replace
it.
Now I wonder, it may sound silly but are there two rev C BASICs? or
maybe there are just some faulty BASIC ROMs about?

Can I just put a bullet in this thread? Bill Wilkenson, in his
COMPUTE! column, talked about the A, B, and C Basic revs at some
length. Basically...

Rev.A: Bug in the "delete line" code.
Rev.B: Rev.A bug fixed, but "add line" code messed up. Since you add
lines of code more often than you delete them, this bug is
actually worse. Also introduced the infamous expanding
program bug.
Rev.C: ALL bugs fixed!

Hmm.. there is no drive setup util for SpartaDOS? Under MyDOS you just
set up the drive as high capacity, 65536 sectors, double density, and then
format it. Of course, MyDOS needs to be reminded of this setup which is kinda
dumb, but oh well.. '78/79 technology.. :^/

It is EXTREMELY difficult to get a DLI to change colors more than once per line! It has been done; look at the small Our5oft demo or the intro to the Sweet Illusions demo; but these are the only two places they've occured.

I'm 99% positive they must be PMgraphics.

Ataris logo is based closely on Apple logo, the difference is about two more commands that Apple logo does not have. I have one set of docs, and two cartrages. If I looked I might be able to find more, but they aren't forsale (yet) but if you are ever going to be in Minnesota maybe you can look at them and do some photocopying.

I would recomend though that you check out a library, for anything on Apple or Atari logo. If there is an Apple // users group around your place that would be a good place to start.

Body handling: HTML body converted to readable text

Ben; this is sort of bashing for public consumption, but it wasn't really Atari's decision to have the two different types of output on the chip. I think we can lay that one directly on Commadore or maybe the folks at Motorola who did the 6820 chip. I don't know for sure who came up with the first PIA style chip. Atari probably just went with the flow rather then design their own chip like they did with POKEY, GTIA, etc. As Richard Dell pointed out, there's as many problems created by working around the design as there are solutions. Do things like put pull up resistors in the output stage in addition to the internal ones & run the risk of there already being pull up resistors in the device you'e attaching it to.
The PIA port A doesn't just come straight out either, they run it through a resistor <220 Ohms?> and an inductor. There's also a capacitor in there that Richard calculated the charge time for. It's just an opinion, but if you didn't have all this gunk in there everytime you plugged in a JS it would effectively be a broadcast antenna. I'd guess the way a real engineer would do it is to have a CMOS buffer chip like a 4049 or 4050 in any design they do from the JS out. If Atari would have wanted to, they probably could have added an I/O buffer stage in between the PIA chip & all the RFI stuff, but they got cheap!
Rick

1681. 8-bit technical docs

James james james..

Using extended memory is kinda a bitch to do on this "640K is all anyone'll need" IBM platform.

You've gotta do access via hard drive for >~500K disk images. Besides, I think (at least on my PC with the "15 seconds to load EDIT" hard drive/CPU) it's a lot quicker to say "ok, use that file" rather than "please, take forever to load it; and then to save it when i quit!" :)

-bill!

1685. Re: SIO2PC on a 12meg 486

JK; what version of sio2pc are you running? I think 3.17 & 3.19 both just
go to a disk file with the "force physical access" set. This happens
even if you've just a 'k or so short of enough ram to use put it in memory.
You could always try a 12 meg ramdisk on the clone. Matter of fact, now
that I think about it I'm going to try it right now. A friend made a
tempory trade, his Toshiba lap top for my 5Hp log splitter.

Just got back from the Compucat WWW sale. Neal has a couple of interesting
8 bit items there. Stuff may be one of a kind, but nothings over a $1
and some of the stuff, like Basic XL for a buck seems like a good deal.
He's also got some technical manuals like the 850 Field Service Manual,
Mapping the Atari, ... all for a dollar or less. Ditto for 825<#?>
printer ribbons $.25 each.

Probably one of those times I was two weeks behind reading the
posts, unlike the last week or two when I have been getting time
daily, just about.

Anyways, digging out the spec bookcs, it is worth noting that
there is a bit more difference between the 6820/6520 and the 6821
than just the I/O differences between the two ports. The 6820
seems to have been designed with one input port (the A port) and
one output port (the B port) in mind. These two control lines
have different behavior between the two ports when set to
handshaking mode.

First lets cover the port differences. The B port was designed to
be primarily an output port, and is able to directly drive the
base of an output transistor with no intervening resistor (these
are, after all, only smart controllers, not _REAL_ computers
<grin>) It will supply 1.5 mA at an output voltage of 1.5 volts
(the base voltage of a darlington pair). Also, though I am hazy

in reading this one reference I have at hand (not a complete spec sheet for the 6820 .. I have those around _someplace_ though) which says that a B port pin assign to an output becomes a tri-state during an input operation. I think this is trying to say that the resistive type pullups on the A port are always there, while the B port has no pullups if used as an input. I vaguely remember something about that. No specs in this reference about the A port resistive pullups.

The 6821 appears to function (more or less) identically, which is contrary to what I aluded to before, and makes me really want to dig out a real 6820 spec sheet someplace. I know I have a board for some sort of DA type work that said it would only work with 6820s, not 6821s. The 6821 spec does say that it both ports are capable of driving two standard TTL loads, perhaps in the 6820 the A port has whimpier sink transistors and can only drive one TTL load ... I'll have to find out now.

So, for the 6821 since I have that spec sheet, the A type lines as inputs source (typically) 1.3 mA at input voltage of .4 V. My math says this is equivalent to a 3.5 K pull up resistor. (wait .. this might be the difference tween a 6820 and 6821 .. the output A port transistors could be 50 % larger to absorbe this extra current). The B port as input is tri-state, with only leakage current. As outputs, for the 6821, will sink 3.2 mA at an output voltage of .4 volts (two TTL loads), both the A and B ports for the 6821.

Handshaking lines, CA1, CA2, CB1, and CB2. CA1 and CB1 input only, with the control being two bits (0 and 1) in the corresponding control register. Bit 1 for polarity control, and bit 0 for interrupt enabling. The ones that start this train of thought, CA2 and CB2, are controlled by three bits (bits 5, 4, and 3). Bit 5 is the direction, 0 for input, 1 for output. As input, bit 4 sets polarity, 0 for negative edge, 1 for positive edge, and bit 3 sets the IRQ output response, 0 for disabled, 1 for enabled. As output (bit 5 high):

bit 4 bit 3 CB2
0 0 low on the positive transistion of the E pulse
handshake following an MPU write of the B data register.
mode high when the active edge of CB1 acknowledges.

0 1 low on the positive transition of the E pulse
pulse following an MPU write. high on the first E pulse
mode after the part is deselected.

1 0/1 programmed output mode, the output follows the 3
bit.

CA2
0 0 high on the active transition of the CA1 input.

handshake low on the negative transition of the E pulse after
mode an MPU read of the A register.

0 1 low on the negative transition of E after an MPU
pulse read of the A data register. high on the negative
mode transition of the first E pulse after the part is
deselected.

1 0/1 programmed output mode, the output follows the 3
bit.

Note that handshake mode is oriented to reads of the A port, and writes of the B port. I suspect, if using the A port for output, that all one has to do is read the port directly after writing it. Similarly, if using the B port for input, one could just write the port after reading it (which stores in an internal register, isolated from the I/O pins if it is an input pin). Programmed output mode, of course, gives one complete control over the transitions, and is the one I would tend to try using if I was flipping directions around (so I would _know_ what the darn bit was doing at all times).

Also note that as inputs the CA/B 1/2 lines are edge triggered. I would not read the port right away if I suspected ringing on the lines, but wait a few microseconds for the data to settle before reading it. A few NOPs to slow things down might work nicely to make things more reliable.

1688. SIO2PC ram usage

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-24 02:46:27 UTC
From: James King <jeking7@delphi.com>
Message-ID: <pi54M5j.jeking7@delphi.com>
Source record: 94129

I have a 486 DX2/66mhz with 12meg ram, yet when I try to create
a 1meg image, (or less), I get an out of memory error from SIO2PC.

Does SIO2PC only use 640k and nothing beyond? This is really
frustrating.

What a waste of 12meg ram!

>Russ.Gilbert@apk.wariat.org
>(calling from hard to get on cb541@cleveland.freenet.edu)
I doubt an Atari issue product would use segmented DLIs - DLIs as a rule are prone to timing errors when the keyboard is read, a rather awkward situation for a word processor.

My guess is that the whole screen has a PMG underlay - all the PMGs ready to show, color set to black. Individual bits would be set according to the need of the program. The cursor would be done the same way.

If they really wanted to get fancy, they could control the PMGs via a DLI and get rid of the reserved memory required; just keep a pixel map to poke into the appropriate register for each line.

SIO2PC will work on a 8088, so it won't read anything over 640k. But, on the
plus side, just open a DOS box under OS/2 to run SIO2PC, then you've still got
11+ megs to play with for your other applications.

Alas, sadly the US 600XL's do not have a monitor jack, but most have the
traces for monitor output on the motherboard, you just have to fill in the
missing components and add a monitor cable.

Message-ID: <Pine.SUN.3.91.950224000130.20280C-100000@PEAK.ORG>
Source record: 94135

I remembr seeing a Polish (I beleive) demo that was unbelieveable.
I can't remember the name, but it's probably commonly known.

There were lots of colors on-screen (DLIs, I suppose), but there were other neat things....like there appeard to be more things moving independently than there are PMGs. Most interesting was the mix of more than one graphics mode on the same scan line. Anybody care to speculate how this was possible?

Is the Umich archives the best place to turn up demos like that? I'd like to get a big collection. Once in a while the PC friends will see an Atari8 demo on my ol' machine that'll even catch their eye. Of course, they're so spoiled with their Super VGAs that they have no understanding of what a feat this must be for the programmer/machine. I'f I figure out how to upload via the net, I'd like to post what demos I do have, if they aren't available.

See ya.

James

List of software (new stuff), games (few), hardware (quite a bit), books (few).

Well, I found some more 'stuff'. The hardware is bulky; I can't keep it all.
Anyone want anything? I get a lot of mail so the first offer will probably
get it, but I will TRY to answer everyone as soon as possible. Please make
offer/counter-offer.

Software;

Music Construction Set (Will Harvey's, Electonic Arts), Disk w/docs.

Movie Maker, the animation Construction Set (Electronic Arts), Disk w/docs.

Atari-writer CART w/docs

Atari-writer+ docs/w disk.

APX spelling checker disk for Atari-writer w/docs

APX printer drivers for above, disk w/docs

APX Calculus Demon (Disk w/manuel, APX software) {doesn't anyone do symbolic calc anymore?}

APX Flight Simulator (Disk, no docs)

B-graph (Batteries Included, disk w/manuel) {Probably the BEST plotting/curve fitting
software ever made for Atari}

Programmer's Workshop Stat. Pack. (no docs!)

Alpha Advanced Protection Techniques Disk Utils (disk)

Alpha Systems BASIC Turbocharger (disk w/docs)

Alpha Diskpack 1000 (disk)

MMG BASIC Compiler (no docs)

Santa Cruz Graphics Machine (no docs)

Monkey Wrench II XL (same as Monkey Wrench II but for XL only, not left cart, no docs)

Font Editor (Irata Verlag)

Super Label II (Irata Verlag, no docs)

Allen Macroware Diskwiz II (no docs!)

Music Composer Cart & Manuel (Atari, w/manuel)

Atari Home Filing Manager (disk w/manual)

XLENT Software (Disks w/docs); {Really very good for fancy hard-copy, do a newsletter, and to view 80 col. on screen!}

Rubber Stamp

Typesetter

Page Designer

Mega-Fonts II

Mega-Filer

HiTech Expressions Stuff; (Disk w/docs)

Award Ware

Card Ware

Heart Ware

Jingle Disk

PRINT SHOP STUFF (Disks w/docs); {how about $1 each for these, or $10 for all 12?}

Graphics Disks for above, #1, #2, #3

Gag Disks for Print Shop, #130, #224, #233, #225, #226 (Icons)

No Frills Software Fonts & Borders for Print Shop

Genesee Atari Group Icons for Print Shop

Genesee Atari Group Cute Labels

Sourcer's Apprentice (Magic Atari Disk)

GAMES

Chess Master 2000 disk for Atari w/manuel

Ace of Aces (Acclocade, disc w/manuel)

Mig Alley Ace (Microprose, disc w/manuel)

225B Baker Street (Datasoft, disc + notebooks) {One or multi-player Sherlock Holmes. Like the CLUE board game}

Eastern Front Cart, Atari, (no docs.)

HARDWARE:

Atari 1010 Program Recorder (Newer Style)

Star Gemini 10" Printer

Protecto Big Blue silent 9", 80 col. thermal printer w/Atari interface & docs.

Atari 810 Disk drive w/power supply

Atari 1050 Disk drive w/power supply

2 good working Atari 800XL computers w/power supply

1 good Atari 800 computers, working (CITA) w/power supply,
$15 w/o mem, $20 ea w/16k, or $25 w/32k, or $30 ea w/48k, or make offer

Atari Books

Second Book of Machine Language (Mansfield, spiral 442 pgs., Compute! books)
(this one was removed, but I did not sell it, so here it is again)

Compute!'s First Book of Atari Graphics (spiral, 248 pgs)

Games for the Atari (S. Roberts, paperback 115 pgs.)

Atari Basic, Faster & Better (Carl Evans, paper back, 290 pgs.)

Atari Basic (Richard Haskell, paper back, 170 pgs.)

Proto's Graphics Machine (Geoff Caras, Pamphlet, 25 pgs)

Learn to Program Fancy Fonts (Rich Wilson, pamphlet, 68 pgs, w/disk)

IBM-PC (Wilson, pamphlet, 45 pgs spiral)

Atari Dos 3 (pamphlet, 30 pgs)

Atari Dos 3 Reference Manual (spiral, 98 pgs)

Atari Disk Operating System II Reference (pamphlet, 98 pgs)

Atari ST User's handbook (Gilbert Held, paper back, 167 pgs)

I got the books some time ago from a friend who was getting out of Atari; they were not mine originally, but I hate to see them go to waste.

(Bill K and Dave (P?) say ATW does the black <SELECT>E and H
with pmgs. I said DLIs. Nope, I'm now quite sure it is like
Bill and Dave say, PMGs. An over(under)lay of all four players
and all four missles covers the entire screen. Then it would
just take setting a bit in the correct player or missle
area and the background would change to the set color. I
looked up the source to 'CrashDive' in Analog and saw how
Brian Moriarty made his neat screen using PM graphics, so
I understand it a little better. About more than one graphics
mode on a single scan line, it may be more the appearance of
two modes on a line, but not really.

Of course, none of that helps in programming the triggers lines,
as a perusal of the prints verifies that the trigger lines go the
the GTIA chip, pins 8, 9, 10, and 11. The PIA lines are used as
follows for the SIO bus: CA1 is the PROCEED input (pin 9), CA2 is
the drive to the MOTORbar output transistor (pin 8), CB1 is the
INTERRUPT input (pin 13), and CB2 is the COMMAND output (pin 7).

Now with a little creative wiring, perhaps one could grab a pair
of these lines (say CA1 and CA2) and use them for handshaking for
the joystick port I/O. Anyone know how the operating system uses
these lines? (Of course, we know how COMMAND and MOTORbar is
used, to signal commands on the SIO bus, and to control the
cassette deck motor).

>(except by bying a 1064)

The latest B&C ComputerVisions catalog I have (dated 11/1/94) lists
two 64K RAM upgrades--one which plugs in (at US$19.95) and one which
is soldered in (US$18.95)--specifically for the 600XL.

So unless these are the "1064s" you refer to (I plead ignorance),
there is indeed something designed to upgrade your 600XL memory.

Sorry, but 10% wins this time. There's no way DLIs can be used to change individual character colors on a line... at best you can manage four or five color changes per line, and at a horrible cost in CPU time.

AtariWriter uses PMGs to produce the "black-background" effect. Try filling the screen up with blacked characters, then scroll them. You can see the PMGs being redrawn.

From: kendrick@zippy.sonoma.edu
Message-ID: <3il023$5q6@nic-nac.CSU.net>
Source record: 94149

You're thinking of the Our5oft demo.

The very top has a swinging green logo (PMG's)

The middle/top has a large multi-colored font scroller (cool font, too!)

The middle/bottom and bottom has:

left: sideways in Gr.8 the address of Our5oft
middle: in Gr.9 a picture of a girl
right: in Gr.15 some monster shapes or something

Bouncing in the middle is a big yellow-highlighter-colored blocky PMG ball.

Bouncing all over are 8 characters: O U R <monster> 5 O F and T

Their trick here was:

No more than two characters per scanline. Each character had three colors
(shades of green I believe). That makes, 6!? Players! The Atari can only
do 4 players + 5th player (made out of the missiles).

The OTHER trick they did to do THAT was the "2 colors XOR'd into 3" which
ANTIC (or C/GTIA?) supports. That way, when you do like:

Player 1: Player 2: Result is:
11111111 22222 2 33333113
11 11 2222 332211

etc.

Anyway. The Sweet Illusions demo also does the multi-modes per line and
is a huge demo (two double-dens. disks) You need a PAL machine to get to
side two though! :(:(:(

SPRING ALL MICRO SHOW UK

I realise this won't be of interest to many US users, but there have been quite a few UK users on this net recently. This is more likely to interest them.

There will be a computer show (SAMS 2 - Spring All Micro Show 2) at Bingley Hall on the Staffordshire Show ground on April 15th 1995. Just about every Atari supporter in the UK will be there. Its the event of the year. If you're interested e-mail me for more info.

Actually I think that the commodore cartridge for the 64 and plus4 is also
the same. I have one on a plus4. I once wrote a nice application that
used all of the commands available with the exception of the turtle stuff
and some of the math routines. It basically drew a calendar on the screen
and managed appointments and bill paying. Worked pretty well. If any
one is interested I could try to figure out how to get it to a pc so I
could post it. It did use commodore specific character graphics to draw
the calendar outline but this should be too hard to convert.

I believe the source for all three was from Terripin.

1714. Corvus hard drive system found!

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-24 22:40:16 UTC
From: jeking@xmission.com
Message-ID: <3iln8g$7vj@news.xmission.com>
Source record: 94154

Today, at a local thrift store, I happened to come by a Corvus hard drive system. Not sure if this
particular unit was made for the 8bit Atari, as it had no documentation, cabling or labeling. The only
labelling on the hard drive case was Corvus Model 16MB. It appears to be intact, except for a little three
prong plug that goes in the rear labelled OMNINET ADDRESS TAP.

1) is this unit for the old 800 Atari?

2) where can I find the missing cabling, software and documentation??

ANY help greatly appreciated.

Howdy James

Hmm, guess you never contact one of the Pro!-Nets. I recently posted an
article by Erhard Puetz (a.k.a. Atreju) originally published in the ABBUC
(see FAQ) magazin (in German), which I had translated to English.

It would have told you, that the XEP80 will run up to 9600 baud with BobTerm
at this moment. The XEP80 should be capable of 19,200 baud. And yes,
with a little bit of hardware, we could hang it on the PBI.

PLEASE, do NOT ask me ANY tech. questions. I ONLY TRANSLATED the article.
Which did not include details about the hardware you'd need, or "ready to use"
device drivers BTW.

Hope this helps. Maybe somebody could post the article here or upload it to
umich or something. (I don't have much experience with this).

Re: GUMBY

There are special demo's (just a few, I guess) for the Gumby, and it sounds
cool. I've had somebody else install it for me. Ever since the upgrade,
one of the POKEY's seems to die. Include the capacitors the designer talks
about, it saves lives ( well, atleast that of the POKEY's)

j >mechanism off your existing XF551. The 551 is D1: and the 3.5" is D2:.
```

Howdy James

Seen it? I've got one. Since I also have a BlackBox and FloppyBoard (and my #2 XF551 had the "wiggle my cables and I might work" syndrom), the 3.5" that came with the "Dual drive upgrade" now sits in the case where the mech. from the #2 XF551 was. The "old" 5.25 mech. now resides in my MiniTower (nope, just the 1.44 meg and 360 plus power supply in there, not the computer itself). You still follow? :-)

My 3.5" 720 kByte drive had/has one problem though (don't know if all upgrades have this, or if I burned something soldering the wires for the upgrade), on larger files (like 200 sectors or more), the XF551 would write a sector 52 tracks to far to the inside of the disk. This would happen on both sides. Since I've got the BB/FB combo, I haven't had the problem anymore, but I'm now using the 720 kByte drive less then before and if I do, I often use it when downloading QWK packages, and downloading never was a problem. With downloading, filesize didn't matter, to error NEVER occured. If I just copied or UnARced a big file, it would screw up one or two files (one containing an empty sector, the other containing the information that should have been in the "empty" sector).

Call Bob Puff, he was stunned, didn't know the answer. Maybe I should replace the 8040 or the 1772 as he suggested. But I've got lots of things to do first. Like ordering the 2Mhz chips for the BB, and the chips for the printer spooler.

Only conventional.

>I have 12meg ramon my 486dx2/66, but when I try to create a 1-6meg
>image file in ram, I get an insufficient memory error.

You'll have to make a "file access" disk. It should do that
automatically. If you have RAM to spare, you could create
a RAM disk, and run the image from there (for more speed).

I am in need of Atari games for the 800 and 1200 models. My 3 year old boy and neighbors kids enjoy the diversion. I recently ordered a few from a store in CA but they have not arrived yet. Where can I download programs from the Net? Can you help me find FTP sites or do you have a better idea? FTP sites have not been cooperative. There are too many users or the keywords are not understandable.

Please help.

James,

The Corvus Drives for the Atari's have a 34 Pin IDC connector.
OmniNet is used with "twisted pair" cabling, and required special
interface cards to use with Apple II's, IBM's, MAC's, etc.

I've got a couple Transporter Cards if ya want to try it out with
an Apple II. <grin> Mike

My Atari 800 served me well in Grad school. A good investment.

Since I have been working on a PC clone for a few years it is time to pass along my hardware to our children and their friends. Can anyone locate public domain or other inexpensive software for kids? If you recommend FTP, please keep in mind that FTP is difficult to access and that I am a novice in this field. Guidance is requested.

1727. Anyone have a part for a 1027 printer?

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-25 04:58:53 UTC
From: ziggy29@rahul.net
Message-ID: <3imded$rs3@hustle.rahul.net>
Source record: 93917

I just picked up a dirt-cheap 1027 printer. The ink roller is weak, but I can replace that. The other problem is a bit tougher, and I wonder if anyone out there can help.

On the printer, there's a "tray" (for lack of a better term) resting on it where you set paper. The problem is, I don't have that piece. So if I wanted to print anything out, I'd have to guide it in manually, one at a time. (All I've done so far is a LIST "P:" on a short BASIC program.)

It's not worth a *great* deal to me, but if any of you have hopelessly busted 1027s around, if this part is on there, I'd love to have it, and I'm willing to throw in a couple bucks plus shipping if I could get it. (Oh, and a manual would be nice too. If I had it, I'd know what to call that thing.)

Go for Gopher.

Gopher to: gopher.archive.umich.edu

Go to the "Merit Archives" menu, then to the "Atari archives menu" and
then into the "8bit" directory.

Be careful though. Some files are recognized as "PC Binary" but many
(especially DiskComm (DCM) files) are believed to be text by Gopher, and
thus translation (and probably bit-stripping) is done on them.

Normally, you select a file, hit [Return] or [->] and the file is downloaded,
but I suggest using the "S"ave command. The Gopher'er I use online on my
Unix account even has a "D"ownload command so I guess it can DL without being
dumped on my account first (and THEN transferred to my computer).

Good luck!

1730. HTML on the Atari

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-25 08:23:17 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3impdl$imh@nic-nac.CSU.net>
Source record: 93920

Well, out of boredom, I've started working on a simple HTML viewer for th
Atari 8-bit. It's nothing like HyperIt!, which is graphically based, it's
more like Lynx in that it is just plain text (with OH! inverse).

I'll eventually either add PMGs/multiple DL modes or a good GUI style
interface to spruce it up.

So far, it supports: Title, Header, Center, Bold, Italic, Ordered Lists,
and UnOrdered Lists.

No anchors yet; or inline graphics; etc. etc.

As for online support.. keep dreaming (or whoever it was working on 8-bit
SLIP, keep up the work! :)). What I may do is say

"download all of the files from that page's directory"

and then when an anchor (link) says something like

href="crap/blah/stuff.html"

it'll just change it to "D:STUFF.HTM"

(oh, I guess I should've mentioned, get the stuff from that page's directory,
and all directories within it (and hell, the ones preceding it too! :))).

It could get messy, but it's still neat. It's 100% Action! Supports ASCII
or ATASCII EOL's. Collapses spaces. Wraps after ~35 characters (giving
space for ordered lists' preceding numberings) but doesn't word wrap.

Inotherwords it looks som
ething like this. But th
at's ok for now I guess.
Adding word-based wrap sh
ould be easy enough!

Oh, and it also supports Paragraph, Break, and "HR" (line? dunno what HR
stands for)

If anyone wants to see it, it's at version 0.1 and I can compile it with the
Action! runtime for those w/o Action! to play with. (I'll include the source
unless you say not to.. or .. maybe I won't include the source unless you
ask me for it? Ah hell with it; either way, state whether or not you want
the source :)) (YES, the source HAS comments, and Rick Cortese even said
it was "pretty" source and very understandable! :))

1734. Hard drives that'll work with a MIO

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-25 14:11:26 UTC
From: mattk@netcom.com
Message-ID: <mattkD4K7F2.BoA@netcom.com>
Source record: 93930

Hi all....

Some time ago, several members were having a hell of a time trying to get a HDs to work with MIOs. Most of the problems seemed to revolve around most SCSI drives being low-levelled with 512 byte sectors while our venerable 8bit uses 256 byte sectors. I've since lost touch with those individuals (sorry!). I'd like to know what was learned/etc. It seems to me that some sort of a HD faq for 8bits might be in order. Or at least an info file. There seem to be more and more interfaces out there. Do they all suffer from the same problem...how do you format the guy for use with the 8bit?

My interest in this is my 8bit is currently shelved (no time or space for it), with a 256k mio and a 20mb SCSI drive (forgot the make...it was in a Mac SE originally, methinks). Once I have time to get it all back to life, my first project is to get the HD working. Then, I'd like to package it up (that's what's kept it boxed up--too many cables and spaghetti).

Hasta,
Matt

>I take it you've never played Rescue on Fractalus, that game was great!!
>Unfortunately, my copy of it was destroyed... if ANYONE has a copy they'd
>be willing to sell, or know where I can find one, let me know!! Thanks.

That was a very good game, but I also loved Spelunker and Clowns & Balloons.
In fact, the only reason I bought a used Atari 8-bit system was that I wanted
to get these 2 games after playing them on a friend's Atari a long time ago.
So I bought a system and have never yet found those 2 games. I probably only
have a couple dozen Atari games, most of which are not worth playing.

I also have a Commodore 64. I find myself using that one instead of the Atari
for the simple reason that it's easy to find a cheap C64 version of virtually
every pre-1990 game, but on the Atari it seems to be impossible. I know they
exist because I've seen many of them, but where they all went is beyond me.

JK; just got through running around Ultima III using a ramdisk with both straight running from image & the /P force physical access flag set. I really couldn't tell much difference in speed. If you do find a handy way to create a 16 meg SD partition, please share it with me. Right now I have to create the larger partitions with MyDOS, then use them with MyDOS or SDX. I seem to have trouble with any DOS when I try to use drive #6, MyDOS directories under SDX, formating anything but drive #1 <?> under SDX. There's also a problem with using the MyDOS duplicate disk function. For the version I have you need to give it a range of sectors i.e. 1-720 rather then let it go on it's own.

I was going to hook up an 8" drive to my ATR8000, but I don't have
any of the docs for it. I can figure the 110V motor needs 110, but
the other two jumpers are a mystery. It's two side by side Molex looking
3 pin sockets. They are cross numbered on the board so it's something like:
--- ---
: o :: o : 1&2
: o :: o : 3&4
: o :: o : 5&6
--- --- Or something like that. Anybody know the specs? I'm guessing
there's at least ground with 5 volts for logic + some AC since it has
a bunch of diodes & a 7905 regulator.
BTW: *if* I get this thing to work, I'll probably give the drive itself
away to anyone who wants it<not my ATR>. I don't want to pay shipping so
it'll probably cost whoever would want it $10-$20 for shipping. It's only
a single sided drive, so I was going to take a peek at some old disk with
it, then I'm sure I'd lose my fasination with it. It's about the size of
8 5.25" mechansisms & weighs about 20#.

I would like to buy or trade for Atari 400/800 carts and acccessories. At the present I only have an Atari 400 with Pac-Man, Star-Raiders, and One on One.

I have a ton of Classic systems and carts for trade. All in very good to mint condition (Coleco, Atari, Intv 1, etc.). If interested in a list, let me know and I can send a detailed txt file.

Also, if anyone can post an 400/800 FAq or point me to a ftp site that may have one, please let me know. Thanx

1745. Problem with MyDOS on XF551 - help! (please)

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-26 03:57:42 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <FB1OAFUUUp@stingray.manawatu.gen.nz>
Source record: 93933

I'm using MyDOS 4.53/4 with one XF551, and my 130XE. I followed the instructions (for once), in the docs (file is MYDOS45M.ARC) and setup the system to format to 360K ds/dd disks.

But, I was testing my ST to 8bit (and vice versa) programs, but couldn't save more than 3 16K blocks (i.e. 3*16=48K) - I tried it on another 360K MyDOS disk, and it got a couple more or so, but not the whole thing.

I then wrote a program to just dump 16K blocks (in individual files) from memory using a little machine code routine that uses the usual SIO channel things. Anyway, I couldn't get past 2 files - it would come up with ERROR 139 (Device NAK) on the third file.

Can anyone please help me out? I usually use Sparta DOS, but want to be able to use MyDOS aswell. I followed the instuctions, typed in the code that had XF551 in brackets beside it for the step rate... So I'm kind of lost to why it doesn't work. It doesn't work on 2 disks - both are 360K, both different brands, but still no go.

Help?

Richard.

PS. Does MyDOS erase the _whole_ file (i.e. not just the VTOC entry), when you delete a file, _and_ when you overwrite it when creating a new file, with the same filename? This seems a hell of a waste to me. I have to admit that I haven't looked through the source code though...

Yes. Like DOS II, MyDos erases the whole file (marks the sectors as unused)
for any delete operation, including opening an existing file as output.
Since the DOS II format doesn't include a list of sectors used by the file,
there is no other way to identify the sectors that will be made available
except to trace the whole file.

1 0V 2 +24V
4 -5/-12V 4 0V
5 0V 6 +5V

The reason pin 4 is marked -5/-12 is because some of the old drives had the option to use a -12v supply (SA80x) - since you mention a 7905, it's probable that you have one of those. The later drives were only -5. There should be a jumper next to the regulator, which bypasses it. If this jumper is installed the drive needs -5, otherwise -12

1750. SIO2PC Suggestion(s)

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-26 14:29:54 UTC
From: jeking@xmission.com
Message-ID: <3iq392$puf@news.xmission.com>
Source record: 93940

What's the best way to contact Nick Kennedy (instead of snail mail) to provide suggestions on updates to
SIO2PC?

I'd like to see it run as a DOS window in Windows (wont work currently), and would like to see it use
Extended and Expanded memory. It would also be nice to see a program for BATCH file xfers to and from
the 8bit Atari - so I wouldnt have to keep deferring to my null modem cable for backups, etc..

1751. Re: best atari games

Check the vendor/developer Faq, and you'll find a good number of shops
that sell Atari 8-bit programs. Look especially to B&C Computervisions,
which carries a huge selection of 8-bit programs for Atari computers.

1752. Atari 800XL System For Sale!

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-26 18:15:14 UTC
From: GPL@ix.netcom.com
Message-ID: <3iqgfi$fae@ixnews3.ix.netcom.com>
Source record: 93942

I have the following for sale:

(1) Atari 800XL
(2) Atari 1050 Disk Drives, 1 is enhanced
(1) Atari SX212 300/1200 baud modem
(1) GoldStar 13" Color Monitor
Several disk and cart's and a jorstick. Couple manuals and dust covers.

All for $150 or best offer. E-Mail me.

Greg :)

1753. 8bit stuff for sale

Summary of Atari 8-bit's an emulated 8-bit Atari's:

Atari 8-bit computers were produced between 1979 and 1987. The
major models released were the:

400 - 8K-16K, 400/800 OS, CTIA or GTIA graphics (depends when made)
800 - 8K-16K-48K, 400/800 OS, CTIA or GTIA graphics (depends when made)
1200XL - 64K, 1200XL OS, GTIA graphics
```

600XL - 16K, XL OS, GTIA graphics
800XL - 64K, XL OS, GTIA graphics
65XE - 64K, XL OS, GTIA graphics
130XE - 128K, XL OS, GTIA graphics
XEGS (Game System) - 64K, XEGS OS, GTIA graphics (Had Missile Command)

All of the XL's except the 1200XL had BASIC installed on ROM. BASIC can be purchased on cartridge for the 400/800/1200XL's.

Branch Always Software are the creators of:
ST Xformer (Atari 8-bit emulator for ST's), Quick ST, Quick Index, Gemulator (Atari ST emulator for PC's), and PC Xformer (Atari 8-bit emulator for PC's).

ST Xformer 2.0 and 2.5 released for the Atari ST 16-bit machines. Very limited. Now public domain (used to be commercial).
PC Xformer 2.0 and 2.5 released for IBM PC machines. 2.0 is limited and supports only 800 OS. Both public domain (were always PD).
PC Xformer 3.0 released for IBM PC machines. Supports all OSes, 320K RAM, and best of all, player/missile collision detection (which MANY games use!)

Graphics:

The Atari has maximum resolution of 320 x 192 (standard, non-overscanned screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4, 160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also supported. 40 x 24 x 256-character (128 normal, 128 inverse, character set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allowed, the other 128 characters have 4th changed into a color 5) and
40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only, and 80 x 192 x 9 color screen modes.
Normal (bordered), narrow (underscanned), and wide (overscanned) screen modes are available.
Screen modes can be mixed (by lines) down the screen using the Display List (a program which is executed by the ANTIC graphics chip every screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.
All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection (which is not supported by the PC Xformer 2.0 and 2.5 and ST Xformer programs).

Sound:

Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4)
can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only
modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/800's
(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

Objective of this file:

At the time of its release (mid 1994), much discussion went on in the
comp.sys.atari.8bit Usenet newsgroup about the Atari 8bit emulator for
IBM / MSDOS based computers, the PC Xformer 2.0 (XF2 for short). Many
people in the 8-bit community had gotten, well, fed up with the XF2-based
questions which did not pertain to them, or to the really dumb questions
which were in fact understandable to new or rusty Atari 8-bit users, but
had just gotten on the nerves of some of the comp.sys.atari.8bit
readers/digest subscribers.
This file was created to reduce the number of 'newbie' and XF2
questions. Now it's becoming a fairly good reference (and got me the job
of writing the commerical 3.0 release's documents!).
This FAQ will present answers to simple questions like "how do I turn
off BASIC" (a good answer to that of course is, READ THE FRIGGIN' MANUAL)
and "how do I get a disk directory?" (which is less obvious on
Atari 8-bits, err.. MOST 8-bits <grin>).
It will also direct people who are unaware of the large amount of Atari
8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a
supplement for the many official and unofficial files floating around the
net (like the official FAQ, the Vendor/Developer List, the Who's Who list,
etc.).
Since revision 0.4 of this file, PC Xformer 2.5, a replacement for 2.0,
and 3.0, the first commercial release, have been released. It is assumed
that the reader has the latest versions of PC Xformer (2.5 or 3.0), although
if you have 3.0, I must say, those documents are great! (If you don't get
the joke, look at the name of the author of the manual, and look at my name.)

---=== Xformer Questions: ===---

Q.1) What does "READY" mean?
A.1) This is the Atari BASIC prompt. See below for hints on Atari BASIC.

Q.2) Why doesn't this program load?
A.2.1) The program may not work under the Atari 800 Operating System, it may
require the XL/XE Operating System. Be sure you're in 800XL or 130XE
mode. (130XE mode is only supported by XF3.0, not 2.5, but there is
no real difference in the operating systems.)
A.2.2) It may not work under the XL/XE Operating System (rare cases), switch
to 800 mode.
A.2.3) Be sure you turned BASIC off before trying to load it if it cannot
run with BASIC on.

A.2.4) It might be a BASIC game! Be sure you're in BASIC and use the BASIC
"RUN" or "LOAD" (and then "RUN") command. Also, be sure it works
with the BASIC you have. Some programs only run in BASIC XL or XE
(which are both cartridge-based BASIC's not currently supported by
the Xformer), and some run with TurboBASIC XL (disk-based).
A.2.5) It may just refuse to run on the emulator.

Q.3) How do I turn off BASIC?
A.3) To toggle BASIC on and off, press [SHIFT]-[F10] ([F10] is [RESET], note:
on a real Atari 8-bit, [SHIFT]-[RESET] does not have this effect).

Q.4) Why doesn't this game/program run correctly?
A.4.1) It may use player/missle collision detection which is not supported
on the XF2.5. You might have to shell out the $29.95 for 3.0!
A.4.2) (See Question 2).

Q.5) How do I exit XF and return to DOS?
A.5) Press [F5]. Note: this does NOT temporarily 'shell' or 'jump' to MSDOS.

Q.6) How do I get to Atari DOS?
A.6.1) In BASIC, type "DOS" at the "READY" prompt.
A.6.2) Reboot without BASIC on.
A.6.3) Be sure you have a DOS-bootable disk image as the first MSDOS
parameter after the "XFORMER" command. (DOS25.XFD and MYDOS45.ATR
are both DOS boot-disk-images and are both in the XF25.ZIP file or
on your XF3 disk).

Q.7) How do I use MSDOS files with XFormer?
A.7.1) Add the files to the command line and use them as their respective
drives (be sure the first drive is a DOS-bootable disk image).
Example: XFORMER MYDOS45.ATR filename.ext
When booted the Atari will have two drives, D1: will be the MyDOS
4.50 disk image and D2: will be a write-protected disk which contains
only the file "filename.ext". Note: there are bugs in XFormer which
make accessing files from different directories a bit hard, just use
the MOVE (or COPY and DEL) commands in MSDOS to get the file to the
directory where you call XFORMER from.
A.7.2) Use the MSDOS program S2PC (S2PC.ARC available in the Utilities
directory at the UMICH archives) which allows you to access files
within a MyDOS/compatible .ATR disk image without using an SIO2PC
or the XFormer. S2PC let's you read, write, delete, change directory,
and view the directory of a MyDOS/compatible .ATR disk image. It
can be used via command-line parameters from MSDOS, or as a menu.
A.7.3) If you can, use the MSDOS program ATARIMG, which is much like
S2PC but has a nicer, more graphical (less-menu driven) interface.
(Unfortunately, this doesn't run on all IBM's!)

Q.8) Just what ARE .ATR and .XFD files?
A.8.1) Refer to the XFormer and SIO2PC manuals for details on these files.
A.8.2) Simply put, they are Atari disks, stored as files which are as big
as the disk they represent (an 88k disk image will use 88k on the
IBM). .ATR files are used by SIO2PC (see below) as well as the

XFormer (and the S2PC program mentioned above). .XFD files are used
by ST Xformer (the Atari 8-bit emulator for Atari ST's) and PC
Xformer (XF2,XF25,XF3).

Q.9) What's SIO2PC?
A.9.1) Refer to the XFormer and SIO2PC manuals for details on this program.
A.9.2) This is a program which runs on IBM/compatibles which, with the use
of a simple (and relatively inexpensive) cable, makes the IBM act
as though it were an Atari disk drive. (Up to four drives, actually).
It uses disk image files (.ATR's) and can also let the Atari access
single IBM files (much like XFormer does) as a single file all alone
in its own disk. It also currently allows Print-Thru (all access to
the Atari "P:" (printer) device can be redirected to the IBM's printer,
screen, or MSDOS file; different translations/conversions are
user-defined when the Print-Thru mode is turned on). Finally, with
the use of two programs on the Atari 8-bit (the only two programs
that currently have anything to do with SIO2PC that have been written
(to my knowledge) for the Atari 8-bit), the IBM can be controlled
remotely (commands are sent from the Atari, typing on the IBM is not
necessary) and files can be sent directly to the IBM's drives.

Note: The following sections will simply discuss Atari BASIC, the Atari OS,
and Atari DOS 2.5 and MyDOS 4.5x (because these topics seem the most
relevant to the less-knowledged/experienced XFormer users).

---=== Getting around on the Atari: DOS and OS ===---
I. AtariDOS and MyDOS QuickReference:

MyDOS (4.50 and 4.53) presents the user with the following commands:

[*] Disk directory of current directory (like "dir *.*" in MSDOS)
[1]-[9] Disk directory of a disk drive (like "dir a:*.*" - "dir i:*.*")
[A] Disk directory (like "dir <mask>" and optional output destination)
[B] Quit to cartridge
[C] Copy file(s) ("<source>,<destination>" copies from one place or
disk to another, just "<source>" copies from one place on one disk
in a drive to the same place on another disk in the same drive
(asks for swapping))
[D] Delete file(s) (add "/N" to delete without being prompted first)
(add ">*.*" or ":*.*" after a subdirectory name to delete the
files within it. A subdirectory name alone will delete the
subdirectory (if it is empty and unlocked)). (Acts like both
"del" and "rd" in MSDOS.)
[E] Rename file(s) (renaming multiple files is allowed, but be careful).
(like "ren <old> <new>" in MSDOS - with MyDOS, use "," between
old and new masks.)
[F] Locks file(s) from overwrite, deletion and appending (like
"attrib +r <mask>" in MSDOS.)
[G] Unlocks file(s) (returns them to their default state).
[H] Writes DOS files to a disk (this creates a disk which boots with
the current version of MyDOS you are using and also has the menu
file "DUP.SYS" on it as well). (This is like "sys"(?) in MSDOS.)

[I] Formats a disk (add "/N" after the drive number to do a quick-format
of an already-formatted disk (ie, just a very fast delete "*.*").
[J] Duplicate disk (copies an entire disk, including boot sector,
when using XFormer, it's much quicker to just copy one .XFD or .ATR
to another).
[K] Make binary file: saves memory and makes it binary-loadable. See [L].
[L] Load binary file: loads a compiled program. (like "<filename>" in
MSDOS, except any ".EXE", ".COM", ".OBJ", etc. is still required.)
[M] Run at address. Mainly for advanced users. Reboot is "E477",
reset is "E474" (these are the hex values of the addresses where
the routines to reboot and reset are.)
[N] MEM.SAV: when this is on, whenever you go to DOS (from BASIC,
for example) it will write what is in memory to a file "MEM.SAV"
so that when DUP.SYS (the menu) loads it isn't lost forever.
When you exit DUP.SYS with the "B: Run Cartridge" command, MEM.SAV
is reloaded and the environment should be as it was when you left.
It's probably quicker to simply "SAVE" your programs (if in a
language) which aren't nearly as big as all of the memory that
MEM.SAV saves.
[O] Options: this presents the user with some options. Mainly for
advanced users or special setups. See the MyDOS docs for details.
[P] Set density. Forces a drive to be recognized at a certain density
if MyDOS can't figure it out. (??)
[Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).
[R] Set default directory. (like "cd" in MSDOS and "cwd" in SpartaDOS)
This makes "D:" now the same as a subdirectory or other drive.
ie, "D2:" will make all calls to "D:" act as though they are to
"D2:" instead. Some programs when prompting for filenames do not
add "D:" to the beginning if one is not present, they add "D1:".
If you don't trust a program to look to "D:" instead of "D1:" and
you want it to look to some place OTHER than "D1:" (ie, where "D:"
is pointing which could be a VERY long path list), just add "D:"
to the beginning. ALSO, some programs don't even ADD "D:"'s if they
aren't in the filenames you give and may give errors (138, for
example: device not present, ie, if you said "TESTFILE.DAT" it
may think you want "T:" instead of "D:TESTFILE.DAT").
[S] Set ramdisk number. This is also under [O]ptions.
[V] Verify writes. This is also under [O]ptions. When Verify is on,
writes will be slower but 100% reliable. With it off, writes will
be much faster but possibly not as reliable (on bad disks, for
example). Default is off.

AtariDOS presents the user with the following commands which are identical
to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H,I(some densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not present or
not the same as MyDOS's commands:
[O] Duplicate file. This is used to copy a file from one disk to another
using only one drive. (In MyDOS, giving just a source will make
[C]opy act like DOS 2's Duplicate.)
[P] Format Single. In DOS 2.5, this is used to format 88k (Single Density)

disks. To format an Enhanced Density (127k) disk, just use [I].
In DOS 2.0, [I] is the only format option and only handles 88k.
(I may be wrong, but I have never had a Double Density drive under
Atari DOS 2.0 or 2.5!)

II. General DOS and OS questions:

Q.1) How do I access the disk drives?
A.1) First, you need to have booted with a DOS. All but one DOS is on
disk (SpartaDOS X is on cartridge). When the Atari boots up, it
does some of its 'boot-up stuff' which includes looking for a
disk drive connected and turned on which is set up as drive #1.
It then begins to load from the disk's "boot sector". If none
exists or there's a nasty error on the disk, you get the
"BOOT ERROR" notice until the error is fixed. (On SpartaDOS disks,
even non-bootable disks have a boot sector, but all the boot
sector is is a small program which displays a 'not a boot disk'
error).
To end the digression, the answer to 'how do I access the disk
drives' starts with 'you must boot the Atari with a DOS'. Check
the 8-bit FAQ and the UMICH and other FTP archives for lists of
DOSes available for Ataris, but the most used are Atari DOS (for
compatibility with almost ALL older software), MyDOS (for an
Atari DOS compatible high-end DOS), and SpartaDOS (for a very
high-end DOS which looks much like MS-DOS but unfortunately
cannont run all software which runs fine with Atari DOS and
MyDOS.) Note: SpartaDOS does NOT run on Atari 400's and 800's
(except the cartridge versions and I believe disk version 1.1).
Now that you have a DOS loaded, the Atari understands the
"D:" device (see below for Atari devices). Since there is more
than one disk drive, you have to be able to tell them apart.
The Atari uses numbers when it has more than one of the same
device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3,
etc.!
After the "D:" device name comes the filename. Of the most used
DOSes, only MyDOS supports lowercase letters in filenames, but
since most programs force uppercase entry for filenames, nobody
really seems to use lowercase in their filenames.

Q.2) How do I copy things from one place to another?
A.2) Atari DOS and MyDOS give you the "C" command in their menu
interface. When it asks for a source and destination, you can
use wildcards (* and ? like in most other DOSes) to copy more
than one file at a time. You can also present no destination
so that a file can be copied from one disk in drive 1 to another
disk in drive 1, for example, and the DOS will ask you to insert
each disk.

Q.3) What are subdirectories?
A.3) Subdirectories are places where files go which are just like the
normal directory of a disk, except the they happen to be WITHIN

that normal directory, or even another subdirectory. For example, you can have your disk divided up into the "GAMES" files, the "GRAPHICS" files and the "SOUNDS" files. A directory of the disk (the "root" or "base" or "trunk" directory) will simply list the three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then, if you ask for a directory listing of the "GAMES" subdirectory, you will see the files (and perhaps other subdirectories) within the "GAMES" directory. Think of it as a tree. For people familiar with Macintoshes, "Folders" are simply subdirectories. A window which appears when you open a "Disk" Icon is the "root", and all of the "Folders" within it have more windows in them which also have file and folder icons.
Here's a comparison to using subdirectories on different DOSes
root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\
Note, only Atari DOS would be using drive 1 here, all other DOSes are not necessarily using drive 1, and MyDOS and SpartaDOS may already 'be within' a subdirectory.
In MyDOS and SpartaDOS (and MSDOS), you can change the 'current' or 'default' directory to a different place (a different drive or a subdirectory). "D:" can stand for "D1:" (like AtariDOS always does) or "D2:GAMES:SPACE:"! PLEASE READ THE MYDOS DOCUMENTS FOR DETAILS ON THIS!

Q.4) What does "P:", "E:", "K:", etc. mean?
A.4) As stated before, the Atari has devices. "D:" is added when a bootable disk in drive 1 is read. Other exist as well:
C: cassette - readable and writeable, no filenames
D: disk drive - readable, writeable, random access, directory, files, multiple devices (up to 9 on MyDOS and newer SpartaDOS, 8 on AtariDOS)
E: editior - readable, writeable. This is how input from the keyboard and output to the screen is normally handled. If you wish to type a small file up by hand and have it sent to the printer or a file, use "E:" as the source.
G: graphics - writeable. This is not built into the Operating System but must be loaded. This is an Epson-compatible printer driver which can easily dump graphics.
K: keyboard - readable. This is just the keyboard. Input from it is not 'echoed' back like with the "E:ditor".
M: multi-mouse - readable, writeable? This is not built into the Operating System but must be loaded. This is a handler which runs in the background and accepts input from either a mouse, a joystick or a touch-tablet and displays a mouse pointer on the screen.
P: printer - writeable. Send data to this and it will appear on the printer. You can print files (documents, etc.) by

using "P:" as the destination. The Atari XL/XE OSes support
"P1:" and "P2:", although I believe this usage is rare.
R: RS232 - readable, writeable, concurrent mode. This is not
built in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850 (or
other compatible interface) and receives the "R: handler" code
from it. Other interfaces and the Atari 'direct-connect'
modems require a file to be loaded which contains the "R:"
code. "R1:" and "R2:" is also supported, but also its usage
seems rare.
W: Windowing (screens) - readable, writeable. This is a graphics
8 graphical windowing driver (rarely used, unfortunately!).
It must of course be loaded as well.
Z: RTime8 clock - readable, writeable. This is also not built
in to the OS, but loaded. This is loaded from disk and lets
the user access the "RTime8" real time, battery-backed up clock
for the Atari 8-bit. (This is a cartridge-based device).
I am unaware of any "Z:" clone which let's you set the Atari
internal (non-real time, non-battery-backed-up) clock if you
do not have an RTime8, although I'd love to see one! <hint!!>

Q.5) How do I print something from DOS?
A.6) As stated above, just use the "C"opy command, then use the file
you wish to print as the 'source', and "P:" as the 'destination'.
Example: "D1:DOCUMENT.TXT,P:"

---=== Getting around on the Atari: BASIC ===---

Q.1) What does "READY" mean?
A.1) Again, this is simply the prompt that Atari BASIC (and most older
BASIC's) presents the user when it is in "Immediate" mode.
Entering a command will cause it to act immediately.
Entering a line number and then a command will place that line into
the current program.
Entering a line number alone will remove that line from the current
program.
To start a program, use the "RUN" command.
To erase a program, use the "NEW" command.
To clear variables, strings and arrays, use the "CLR" command.
To load a program, use the "LOAD" command followed by a filename
(see below). To load and run a program, use the "RUN" command followed
by a filename.
To save a program, use the "SAVE" command followed by a filename.
To list a program, use the "LIST" command followed by an optional
start and end set of lines seperated by commas.

Q.2) Where can I learn Atari BASIC?
A.2) A (set of) file(s) will be created explaining all of Atari (and Turbo)
BASIC's commands and their usage. (A larger file may be produced
which will be based on examples provided in the Atari BASIC Reference

Manual). (As of Jan. 7, 1995, these particular files do not exist).

Q.3) How do I quit BASIC?
A.3.1) Type "DOS" to quit BASIC and return to DOS.
A.3.2) Type "BYE" to quit BASIC and exit to the OS's "bye" routines
(Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and
Self Test on other XL's and XE's). (Note: On 1200XL's, use [HELP]
to go to the Self Test when the Atari Rainbow appears).
A.3.3) For XFormer users, remember, [SHIFT]+[F10] reboots and toggles BASIC.

Q.4) Why don't strings work?
A.4) Strings must be "dimensioned" like arrays in Atari BASIC. Strings
are special character arrays. See the BASIC usage/etc. files mentioned
in the answer to question 2. Simply put, to make a string that will
accept up to "#" character, use DIM <name>$(#) . Example:
DIM A$(10) - now A$ can contain between 0 and 10 characters.

Q.5) How do I make graphics?
A.5) Use the "GRAPHICS" command to switch between the following screen modes:
(Note: All modes except 0, 9, 10 and 11 have four lines of 40 x 24 x 2
sized text covering the bottom of the screen. Add "16" to the mode
number to remove this window (but do not make any PRINTs or PUTs to
the standard output otherwise a GRAPHICS 0 screen will appear))
(Note: Add "32" to the mode number to keep the screen from clearing
when it appears. One problem, however, all screens overlay each other
so unless you only use certain modes at certain times, parts of some
screens will become (or start out) with 'garbage' on them.)
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 4 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Commands available in Atari BASIC for manipulating simple graphics
include:
PLOT x,y POSITION x,y COLOR c (c=color or character value)
DRAWTO x,y LOCATE x,y,r (where r is where result will be stored)
SETCOLOR c,h,l (c=palette location, h=hue, l=lum)
Colors:
COLOR command colors are not identical to SETCOLOR command colors:
COLOR 0 will draw using the background color, set with

SETCOLOR 4,hue,lum
COLOR 1 will draw using color "0", set with
SETCOLOR 0,hue,lum
COLOR 2 will draw using color "1", set with
SETCOLOR 1,hue,lum
COLOR 3 will draw using color "2", set with
SETCOLOR 2,hue,lum
Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be
POKEd into memory locations 704, 705, 706 and 707 (the
player/missle graphics color locations). Examples of this will
be presented in the BASIC usage files. (Sorry)

Q.6) How do I make sound on the Atari
A.6) Remember, XFormer 2.5 doesn't support sound! (XF3.0 does)
But anyway, in Atari BASIC:
SOUND c,p,d,v
c=channel (0-3)
p=pitch (0-255)
d=distortion (0,2,4,6,8,10,12 or 14)
v=volume (0-15)
The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT [CONTROL]+[G])

Q.7) How do I move the cursor and edit?
A.7) The Atari "E:" device (standard input/output which is the "editor")
allows the following characters for editing:

Key: AtASCII #: Use:
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)
Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^<]) 125 Clears screen
Bell ([^2]) 253 Sounds buzzer
TAB 127 Moves cursor to next TABstop
ClrTAB ([^TAB]) 158 Clears any TABstop under cursor
SetTAB ([ShTAB]) 159 Sets a TABstop under cursor
ESC 27 Sets ESCape (next edit char after is shown,
not done, non-edit chars shown (like normal))
RETURN 155 Sends End Of Line (moves cursor to lowerleft

of next line, accepts input)
Note: Inverse characters have values of the normal version of the characters plus 128. (The only non-viewable inverse character is inverse-ESC, or what would be the [ESC],[RETURN] combination. The character exists, but must be set into screen RAM by hand. Oh well, at least you still have 255 easily viewable characters! <grin>)

Q.8) How do I make the editor characters appear
A.8.1) As shown above, you must have an ESC sent before them. When simply entering text, type [ESC] then the edit key and the character for that edit key should appear.
When entering text in a PRINT statement, you must have it send an ESC beforehand, so first type [ESC],[ESC] to make an ESCape character appear, then type [ESC] then the edit key and the character for that edit key should appear. When the PRINT statement is executed, the first ESCape (which you typed as two [ESC]'s) will make the editor SHOW the following character (even if it is an edit character), then the character which you entered (with [ESC] and then the edit key) will make that character appear. This makes it difficult to align a set of PRINT statements which make a multi-line picture or menu which uses viewed edit keys. It is probably best to have all of the lines in your program with the PRINT statements that can fit visible on the screen, then edit them (without putting any of the ESCape characters in, then when the picture looks like how you want it on the screen, move the cursor to on top of each edit-key character and press [Control]+[>] (Control-Insert). A blank space should appear under the cursor and the rest of the line should move right. Now, type [ESC],[ESC] and an ESCape edit-key character should appear where the blank space was. When you are finished doing that for each line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!
A.8.2) Set the memory location "766" to "1" with the command "POKE 766,1" to turn on the no-edit mode (ALL characters except End Of Lines will appear, even ClearScreens!) When you want to go back into normal mode, set the location back to "0" with "POKE 766,0".

Q.9) What's with the colors changing?
A.9) THIS, MY FRIEND, IS THE FIRST EVER SCREEN SAVER! This is called "Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE series (and probably on the 5200 and 7800 but I cannot confirm this). When a key hasn't been pressed for 7 or 9 (depending on OS, model, etc) minutes, the screen colors begin changing, thus protecting your TV or monitor from having a static image burned on it.
To turn this mode off, press a key, or, if within a program, use the command "POKE 77,0" at least once every few minutes (IF the screen is active, otherwise turning it off would be kinda useless).
To turn it on, wait 7 or 9 minutes without pressing a key or having location "77" set to "0", or set location "77" to "128" with "POKE 77,128", voila! instant attract mode!

Q.10) How do I access 'devices' on the Atari?
A.10) The following commands are available to Atari BASIC's (and also
variations on these are available in most other Atari languages!):
OPEN #a,b,c,d$ Opens channel 'a' for access to 'd$' in mode 'b'
with auxillary mode 'c'. Channel 'a' must be
free or a 'Channel already open' (129) error
occurs. Examples:
OPEN #1,4,0,"K:" - input from keyboard
OPEN #2,8,0,"P:" - output to printer
OPEN #3,12,0,"D:FILE" - random access to disk
OPEN #4,9,0,"D:DATA" - append-output to disk
OPEN #5,13,0,"R:" - concurrent to RS232 (modem)
OPEN #6,6,0,"D:*.TXT" - directory access to disk
(reads directory of "*.TXT" mask)
CLOSE #a Closes channel 'a' (freeing it for use)
GET #a,b Reads a byte from channel 'a' and stores it in 'b'
PUT #a,b Puts byte 'b' onto channel 'a'
INPUT #a,b$ Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores it in 'b$'
INPUT #a,b Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores the numeric value of it in 'b'
PRINT #a,<stuff> Just like the normal BASIC PRINT statement, but
sends the information to channel 'a' (semicolons,
comas, and mixed types are of course allowed).
STATUS #a,b Reads the error 'status' of channel 'a' and stores
it in 'b'
XIO a,#b,c,d,e$ General I/O call. This a little complicated and
may be expanded upon in a future revision. Just be aware of the
following:
a - command
b - channel to use (usually must be free)
c - auxillary mode 1
d - auxillary mode 2
e$ - file or device to act upon
Examples:
XIO 32,#1,0,0,"D:FILE,OLDFILE" - renames file
XIO 33,#1,0,0,"D:OLDFILE" - DELETES file
XIO 34,#1,0,0,"D:GAMES" - creates a directory in My- & Sparta-DOS
XIO 35,#1,0,0,"D:NEWFILE" - locks a file from over-write and
deletion
XIO 36,#1,0,0,"D:NEWFILE" - UNlocks a locked file
XIO 40,#1,4,0,"D:PROG.OBJ" - loads and runs a binary file
(like "L" in Atari and MyDOS)
XIO 40,#1,5,0,"D:PROG.OBJ" - loads a binary file
(like "L" in Atari and MyDOS with the "/N" option)
XIO 41,#1,0,0,"D:GAMES" - changes default directory that
drive/subdirectory (all calls to "D:" will now occur within
that drive/directory)
XIO 254,#1,0,0,"D2:" - FORMAT a disk (in Atari DOS 2.5, this is

format 'enhanced', to format 'single' density, use XIO 253)
(in MyDOS, this is format, but not 'enhanced', use
XIO 253,#<channel>,1,0,"D<drive>:" for format a drive in enhanced
mode).
NOTE: 39 and 40 are the same. Also note the useage of AUX1 in the
"XIO 40" example.

---=== Getting Atari files to an IBM: ===---

Q.1) How can I read Atari disks on my IBM?

____
[note:] Someone please give more details or corrections here! Thanx!
~~~~~~~
A.1.1) If you have double-density Atari disks, you can use the program
"Util" on the IBM which can read double-density Atari disks. Please
see the Atari 8-bit FAQ for more details.
A.1.2) If you have an Atari 1050 disk drive, you can use the program MULE
to copy files, one file at a time, 20k chunks at a time, from the
Atari to the IBM. You first must format a 180k disk on your IBM,
the run MULE on your Atari to get a file onto the MULE disk, then
run MULE on the IBM to get the file onto the IBM. Tedious, isn't
it? MULE wasn't meant to be a fully-functional program, just a
demo to show that this was even possible.
A.1.3) If you're fortunate to have a Black Box interface on your Atari,
you can get an external IBM drive and the Black Box's add-on, the
Floppy-Board and simply copy files from your Atari disks or hard
drive(s) onto IBM disks via the floppy board, then load them up
on your IBM.

Q.2) Ok, I can't do any of that, now what?
A.2.1) You can use SIO2PC, which is a program for IBM's which turns your
IBM into a set of Atari disk drives. You need the SIO2PC cable
(which you can purchase, assembled or unassembled, or buy parts
and build it yourself) and the SIO2PC software (available at UMICH).
Connect your IBM to your Atari, load SIO2PC, and then run the
program FILE2PC on the Atari to transfer files to the IBM's hard
drive. Or instead create a disk image within SIO2PC and copy files
from one disk (a real Atari floppy) to another (the SIO2PC image)
with the Atari or MyDOS "C"opy command. If you want to extract files
out of the SIO2PC disk image file and store them on your IBM's hard
drive or floppies as single files, either again use FILE2PC or use
S2PC, an IBM program which can extract files from or add files to
MyDOS-compatible SIO2PC disk images!
A.2.2) You can use two modems to download files from your Atari 8-bit.
A.2.3) If you don't necessarily want files that you already have on your
Atari 8-bit, you can download files from the huge collection
available at FTP sites and Atari 8-bit supporting bulletin boards
and save them onto your IBM.
A.2.4) If you have only one modem, so you can't connect both your Atari
8-bit and your IBM together via modems, you can do it via null-
modem, OR you can upload files from your Atari to some bulletin
~~~~~~~

board or account you have access to, and then connect the modem
to your IBM and download the files.

Q.3) Is there any easier way to get Disk Communicator (Atari disk image)
files to and from SIO2PC disk images or PC Xformer XFD disk images
other than using Disk Communicator 3.2 on my Atari! I mean, both files
are disk images! They're both on my PC's hard drive! <cry>
(AND NOTE: DiskComm. doesn't like SIO2PC a lot of the time anyway!)
A.3.1) Yes! There's a new IBM program out called DCM2DSK.
(Why "DSK" and not "ATR"? To keep people from getting confused with
the ATR-8000(?)) The current version is '2' and it's available at
UMich's archives and probably elsewhere. Filename: "DCM2DSK2.ZIP" in
the SIO2PC directory.
A.3.2) There's also a new program which converts DCM's to XFD's. I need to
look at it myself first before I can describe it (or someone help
me, please?)

---=== Where to get or FTP files mentioned in this FAQ: ===---

The PC Xformer 2.0 and 2.5 can be downloaded from the "ftp.clark.net" FTP
site:
Directory/file-path: systems/msdos/emulators/xf25.zip (or xf2.zip)

PC Xformer 3.0 can be purchased for $29.95 (prices may vary) from:

1755. Atari 400/800 Donkey Kong

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-27 00:00:25 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.950226153514.5795A-100000@PEAK.ORG>
Source record: 93952
Cross-posted to: comp.sys.atari.8bit,alt.games.video.classic,rec.games.video.atari

Donkey Kong, in all its insanity, is probably one of my favorite all-time simple-minded games. No telling how much pocket change I dumped in one of those (debut in 1981) until I finally got the Atari 400/800 cartridge.

Any other DK fans out there? I remember playing it on a friend's Colecovision first. It was the rage, and it helped make the Colecovision the rage for a while. However, the 4th screen "Mudpie Factory?" was absent from the Colecovision. The Atari 2600 version was mighty PUNY. It didn't look or sound like DK; it was more like a 2-color CGA Jumpman. It only had 2 levels!!! Intellivision was a little better, but didn't look like DK.

FINALLY...I got my 8-bit cartridge way back then. This was during the first video game craze over 10 years ago. The Atari 8-bit version is the closest duplicate of the arcade that I know of (unless it's available for NES/SNES..I am not familiar with those systems). I was reading some FAQs (gee....I'm actually smart enough to read an FAQ now) about older video games, and in one (I can't remember which), the contract negotiations with Nintendo for the DK rights was discussed. Coleco got it. I think DK was a pack-in for the Coleco. Coleco is to blame for those lame versions for the 2600 and Intellivision.

But notice that your Donkey Kong (8-bit Atari) cartridge is by Atari...part# RX8031, to be exact. Thank God, or Coleco would have butchered it like the other versions, to make the Colecovision look good. HOW CAN THIS BE? Was the "home computer" version under a different license? What about the Atari 5200 version; it was so close to the 400/800 that you'd think a modified 400/800 version would run, but it wasn't a home computer.....Anyone have a 5200 with DK?

James

>Extended and Expanded memory. It would also be nice to see a program for BATCH file xfers to and from
>the 8bit Atari - so I wouldnt have to keep deferring to my null modem cable for backups, etc..
You could just use a terminal program at both ends; use the RVerter handler
(I think) and any Atari term prog. SIO2PC (hardware-wise) is a null-modem
cable; it's the software that monitors the COM port for the command frames.

Dave

I'll have to try that.. Didnt know the SIO2PC would work as a nullmodem cable also.

Thanks for the tip..

The Atari 5200 is just an Atari 8-bit computer in new clothes,
with only minor changes (to support the weird, analog joystick, for
instance). As I understand it, Atari 8-bit software had to be changed
very minimally to run on it (at least in comparison to porting to
another platform entirely). So, the 5200 version is most likely just
a modified version of the same code used in the 8-bit cart.

From: 6500dtpt@ucsbuxa.ucsb.edu
Message-ID: <3iri6k$r9b@ucsbuxa.ucsb.edu>
Source record: 93948

Actually, there is NO Donkey Kong for the 5200.
The way the deal worked with Nintendo was that Atari got the home
computer rights (which is why Atarisoft made Donkey Kong
for the TI 99/4a, Apple //, IBM PC, etc.) while Coleco
had the videogame console rights (so Coleco made Donkey Kong
for the ColecoVision, Intellivision, Atari 2600...)

(All bets are off as to why Coleco was able to make a
Super Datapack version of Donkey Kong for the Adam.)

Does anybody know what the value of the cap in the TTL hack outlined in the video issue of AC is? It says in the mag .002, but doesn't specify units. .002f? That seems a bit large. Any help would be appreciated!

The 5200 has identical chips inside, but someone at Atari not only reworked
the joysticks (producing the unreliable 5200 models) but also re-arranged
the memory map, meaning that hackers had to dump 5200 carts, rework all the
ROM calls and then insert replacement joystick routines, and handle the
second fire button.

Not only for transmitting the files. My dream is to consider and build
something like network. Near stations (terminals) could be connected
with cables, and far stations (f.e. servers) via modems. I'd wish to
have services like talk, finger etc., simply network like on
UNIX-systems. Well, maybe somebody already made it on 8bits - living in
Slovakia, the progress in the field of 8bit Ataris is still very slow.
Anyway, I'd want to know any info about this. If you have something,
please mail at madaras@turing.upjs.sk .

Warp 10 BBS is back online.

I got rid of the cheap, failing , Atari standard power supplies, and got a PC power supply. Works well, and has lots of spare power, which helps with a Mux and extra ram.

So as soon as I get my other keyboard fixed, both lines will be operational. At this point it's:

612-221-989 300-14,400 baud.

Not at home to check the article specifically, but generally
capacitances without specific units given may be assumed as in uF
if given with a decimal point as less than 1 (ie -- .01, .47,
.002), and as in pF if given as whole numbers (ie -- 1000, 220,
30). So that .002 capacitor would most likely be .002 uF.

Note that in this context, .001 == 1000. Very confusing.

"Probably faster then ACTION!" !??!?!?! HAHAHAHAHHAHAHHAHHAHAHAAHHAHAHAAHHAH!

Oh :) SOrry..

Man, you must be thinking Action! is as slow as the C's for the Atari.
WAY wrong there, man.

I remember in the Quick manual, they had TBXL slower than Quick slower than
Action! slower than Assembly. At least for their benchmark.

Heheh.. my benchmark would include easy of use and put Quick down there
with Assembly, C way below that (heheh) and TXBL and Action! up at the top
as the easiest.

:)

>than one graphics mode on the same scan line. Anybody care to speculate
>how this was possible?
If it's the one I'm thinking about, then close inspection reveals them to
be GTIA modes + Gr.8 I think. If I remember correctly you can switch GTIA
modes by toggling a bit somewhere (the number 623 comes to mind... hmmmm, or
is it 559? - those are the shadow registers anyway, you'd need to modify the
hardware equivalent to do it on the fly). Anyway the idea is that you can
switch GTIA on and off by toggling a single bit. You can even do this in
modes that do not directly support GTIA (like GR.0), they're not much use,
but they look pretty. Ok, so the idea is to switch the GTIA bit on and off
on the fly, as the raster is drawing in the screen. So you'd need to do some
cycle counting from the time the raster begins to draw the line to the point
where you want to change modes. Once you get there, you switch the GTIA bit.
Of course there's DMA going on too, so you can't tell exactly when you've
reached that point. The demo I saw had some blank space in between the mode
change, which would allow for this. It may be possible to switch to other
graphics modes too (not just GTIA), as long as they have the same number of
bytes per scan line. That's something I was thinking about several months
ago but have never tried it.

As for multiple moving object... that's one that has always stumped me.
I think they must be software sprites, ie. where you draw them on over the
background and then re-draw the background again after they've moved.

You want CSS's MUX. It lets you connect up to 7 or 8 "slave" computers up to one "master" computer. The master computer would have something like a Black Box on it and the slave computers would share the hard drive space or whatever.

The slaves require a replacement OS and I guess so does the master? The master runs file-serving-type software or something, but the slaves can run anything; doesn't matter. They can all be running the same software, or all be running different software! (Hey, I bet my HTML8bit program would work nicely on a MUX setup! One machine running the word processor or editor or whatever to edit the HTML files (page) and another reloading the thing showing the final output! Cool!)

Anyway, the slaves all have carts attached to them with ribbon cable or something attached and you can of course stack other carts on top.

Is there multiline BBS software for MUX yet!? Do any other BBSes (Pro!, etc.) support it!?

Someone else please give better/more details on MUX as I've never seen nor used one.

Thanx!

Raphael! You just explained how the bitmapped modes were altered via sync
count, HOW could the sprites be software!? When they'd move to the left,
they'd turn into Gr.8! In the center, Gr.9 and on the right, Gr.15!

I explained before that they're just 4 PMG's + 5th player (big yellow ball).

The 4 PMGs allow two, 3-colored (using the 3-color-XOR hardware mode (trick))
PMG's per scanline, which, if you look carefully (you CAN pause the animation
with either stick or console keys) is all they ever have at one time. Someone
pointed this out to me.

BUt, if you WANT to see cool >5 PG's on the screen at once, get Pl8Demo
or whatever it's called (Demo8pl?)

Later!

What you're looking for already exists -- in the form of the CSS Multiplexor (MUX). It allows
to you setup ONE file server (with all peripherals except modem connected to it), while letting
you have up to 8 slaves (workstations) sharing data off that server.

I have 3 slaves on my mux at home..

1781. Little kids

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-28 00:47:50 UTC
From: KENDRICK@sonoma.edu
Message-ID: <950227164743.20403efb@sonoma.edu>
Source record: 94021

I'm kinda sick of the little kids who come over and hassle me with
legos, paints and computers and have stooped so low as to BUILD
something for them! :)

Rather than have them pound on my keyboards, I'm learning this:

Turn off the brightness on my PC's screen (and unplug the keyboard)
BE SURE THEY HAVE SOMETHING TO DO (and that they can understand)

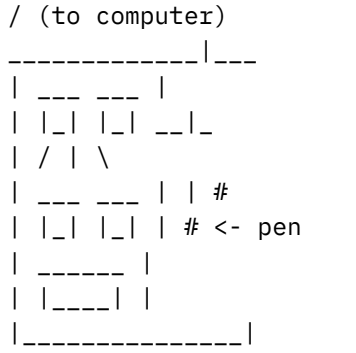
One thing I've found is 3- and 4-year olds

1) Can't read
2) Can't easily find keys on the keyboard
3) Aren't strong enough to use standard joysticks

So, I've built a joystick-wanna-be. It's made out of the following:

Old 9-pin joystick cable with 6 wires (Up/Down/Left/Right/Fire/Power(ground))
Top of an IBM PC case (stiff, plastic, good!)
A lot of foil (my wonder-solder and wiring :) Also, the contacts for
the controller.. see below)
A pen
A LOT of tape
Some wire

The thing itself looks something like this from the top:



On the end of the pen there's a foil contact attached to the wire
which comes out of the other end, goes into the front (the entire
thing (except the foil parts) is covered in paper) and is connected
to the Power (ground) wire of the stick cable. This is the magic "wand."

The top two surfaces of foil are wired up to the "Up" and "Down" wires.

The bottom two surfaces are to the "Left" and "Right" wires.

The long surface at the very bottom is to the "Fire" wire.

This is a VERY simplistic interface, but not only is it a cinche to program for, but it only took me about an hour, hour and a half (at the most) to put it all together!

Some software I made which already supports it (because it supported the following idea: "two button controls". Either "SPACE" or "Any key EXCEPT SPACE" and either "Fire" or "Move".) includes an in-progress dumb little anti-lemmings style game with "gummy bears" which wanter around and you try to get them to a certain spot on the screen. (They fall, jump when they touch special pads, and can get stuck) as well as a "legos" tetris-ish game. Both games are, as I said, stupid. :) But amusing to the kids.

On a side note, I did make a keyboard-based game where there's a happy face on the left, and giant letters (made out of mean-faces) coming slowly from the right. If the closest one is the letter "A", the kid is to type "A" and a line of "A"s shoots out of the happy face and kills the giant "A" (flashes in sad faces for a second :)). If they press, for example, "B", it doesn't do anything. If the letters get too close the happy becomes a worried face :) and there's a simple flashing "YOU WIN" (as if they can read! :)) if you win, or a giant bouncing sad face if you lose.

Anyway, later!

From: kendrick@zippy.sonoma.edu
Message-ID: <3iukmh$c0v@nic-nac.CSU.net>
Source record: 94025

SIO2PC emulates CIO, not SIO. It's at the hardware level! All SIO2PC software does is look at the SIO port; whether they were caused by SIO or by a direct CIO call it doesn't matter, it just responds if it needs to.

1786. Cooltris 2

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-28 08:05:09 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3iulfl$cb1@nic-nac.CSU.net>
Source record: 94026

Ok, status of New Breed Software's (that's me) current projects:

HyperIt!: I need to: Support SpartaDOS
Fix the mouse
Add preferences (colors, etc.)
Rework the Stack-selection interface
Add the "Field" command
Make better error trapping
Add a nicer MORETEXT command

I will eventually: Add Daisy Dot III font support
Add sound/music/digital audio/icons support
Support real Mice/Trakballs/Touchpads/Light pens
==========
HTML8bit: I don't know what I'll do with it, definitely add support
for more HTML command and Anchors, but I don't know if I'll
make an HTML->HyperIt! converter, a true HTML viewer, or what!?
==========
Geneocide: This won't be out for quite a while! :)
==========
Outbreak: Consider this dead and go play Unicum.
==========
Adventure XL: Yes Glenn, I haven't forgot this! I'm perfecting my use of
VBI's and will soon have a nice many-player engine to play
with. Once I have that going and AXL at least started, I can
move on to more of Geneocide.
==========
Cooltris 2: What!? Since when was I going to make a sequel!? Well, it's
been in the back of my mind ever since Richard Gore said
"nice, but just isn't good enough compared to Euro/German
wares" and I read the description of the ST game "Dropix"(sp?).
This will be THE first game supporting my sorta-flickery
souped-up multicolor text mode. (So far, 9 colors with 16+
possible if I want to tweak the color/font designs which I
don't at the moment :)).
==========
ADOS: Yes, the ADOS team IS doing something. I seem to come up
with the most theoretical "we must support THIS aspect of the
interface!" input. Nice yes, practical, I hope so! :)
==========
Megagirl: Once I get Geneocide either out or vaporwared, I'd like to
work on this game very much!
It will of course be using the many-players and more-colors
engines.

```
==============================================================================
ScotchDUP: Sometimes I feel nobody cares <sniff>. Well, >I< do, so
this WILL be done. I seem to be getting closer and closer
every time I try. (Just as I used to get closer and closer
when writing BBSes over and over again from scratch; and I
actually had a relatively nicely WORKING one up, too! :) )
==============================================================================

So, there's the status of New Breed Software as well as an official notice
that Cooltris II is going to be created! :)

Cooltris fans look out for dual-player-mode WEAPONS and actual COLORED
pieces! :)

Perhaps I'll have to redo Sludge as well! :) Any Sludge fans out there?
(Why does no-one LIKE this game!?)

```

1787. Cooltris 2 details

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-28 08:35:53 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3iun99$d5s@nic-nac.CSU.net>
Source record: 94027

Like the original Cooltris, Cooltris 2 will support:

1-, 2-, 3- and 4-piece 'trads
0- to 9-high "garbage" at the beginning of the game
Adjustable percentage of "stuck" (unrotatable) 'trads
Bombs
Crystals
Weights
Two-players

Also, Cooltris 2 will support the following (some of which is
unavailable in ANY Atari 8-bit (and many other platforms?)
Tetris clone!):

Weapons for two-player mode:
Freezer (freeze opponents game temporarily)
Trader (remove your bottom line and give it to your opponent)
Warp (warp your opponent temporarily to the fastest level!)
Gravity (remove all air-pockets in your game area)
Money (gain bonus points)
Love (remove your bottom line AND your opponents bottom line)

Coal:
Pieces that turn into crystals when they're "crushed"

Rain Mode:
Pieces randomly appear as if they've fallen right after you've
placed a piece (like in Dredis, Lineup, etc.)

Color:
Using a special software-driven graphics routine, I've pumped
currently 9 colors: black background plus two shades of the
following colors: red, green, blue, yellow. Normally, in
the parent mode I'm using (IRG4) one can expect black background
plus ONE shade of those colors, or perhaps two shades of two
colors, or three shades of one color and then a single shade of
another color, etc.

Music:
If I can fit some in (and WRITE some! And the player!)

Digital sound:
If I can fit it in (doubt it; unless it's very small and low quality).

(Oops, I forgot to mention, 0- to 4-'trad preview in what Cooltris 2 will
have that Cooltris (original) already had!)

Anyway, how does it sound!? And yes, the slight flicker of the graphics engine IS standable (esp. if you turn your contrast down). I would support "grey" or "reduced color" mode, but it'd hog MORE RAM for MORE fonts. :(Sorry!

Feedback welcome! As are beta-testers. I MAY even release the source!?

>
>James

I loved that game on the 8bit! (of course, I was a poor back then (1984), so I
bought it at a swap meet). I remember after I bought and played it for awhile,
Coleco came out with a "new" version of DK for the Colecovision that was
advertised "Now includes ALL four levels!" (or something similar) when they were
pushing the ADAM computer add-on (I believe this was the situaltion.)
I still have my original Donkey Kong cartidge (somewhere) and it says "under licence
from Nintendo" so I think it might of been like a "source code" licence from them?
(The cart's opening screens reference to a "(c)1983 Nintendo" I believe)

IMHO, the Coleco version still couldn't hold a candle to the Atari 8bit's version.

>Is there any info avalible about how to do this?
>(except by bying a 1064)

I think the best (and cheapest) way is to get two 4464-RAM-Chips (64k*4bit)
and swap these with the build in ones . Then you will have to do three
connections (I haven't in mind) and then you can put on self-test.
I have two 600 upgraded this way - they run good .

Matt

1792. 800XE/(130XE) shows no color - help !!!

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-28 12:20:03 UTC
From: belitz@genesis.informatik.rwth-aachen.de
Message-ID: <belitz.180.000C55F4@genesis.informatik.rwth-aachen.de>
Source record: 94031

I've picked up an 800XE (same board design as 130XE).
The machine runs fine, but it shows no color !!!
I've tried to use the monitor jack, the HF-Modulator always same result.
I've controlled the voltage on the poti (R 38 I think), it's correct from
0 to 8.8V.
Now I have swaped the GTIA with my working 600 XL - The 800 one worked fine
in the 600 - but the 800XE shows no color .
Anybody here who can help me ?

Matt

Atari got the contract to do computer conversions while Coleco got the contract
to do home video game system conversions.

Before you hang Coleco out to dry, the 7800 version of Donkey Kong and Donkey
Kong Jr. by Atari are a worse than the Colecovision versions. The music is
better on the Colecovision version of these two games as well as the sharpness
of the graphics. However, Atari's version has DK on the correct side of the
screen on board one of DK and has springs on the elevator level and an extra
board on DK Jr. However, both lack the infamous mud-pie level.

OTOH, Gameboy Donkey Kong has all four levels (including Mudpie) but they
simplified the levels. :(

1796. GTRACKER demo upload

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-28 15:14:35 UTC
From: CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK
Message-ID: <19A51DD4806@east-01.novell.leeds.ac.uk>
Source record: 94034

I've just uploaded a copy of my GTRACKER Demo disk to umich, well
to lenn@atari.archive.umich.edu, when it appears on the listing
would somebody be kind enough to download and test it please and let
me know if it works, it should!! Once I know my procedure works I
have some more stuff to upload.

The GTRACKER Demo disk is a double sided enhanced density disk.
You will need to download 8 files (5 for side 1 and 3 for side 2)
and use Disk comm 3 to undiskcom them into a disk. There is also a
text file called GTRACK.DOC that gives more details. The filenames
are:-
GTRACKxy.DCM where x=1=side 1
x=2=side 2
y=A,B,C,D or E - part number.

I hope you enjoy it!

Source record: 94036

You don't NEED software on the Atari end to run SIO2PC. Even if you want to dump files directly to the PC's drives, you don't NEED remote. You can set the SIO2PC software for a P:rint through (no translation) into a file and do it file-by-file, or you can simply run S2PC or AtarImg on some ATR file(s) to extract the file.

Good luck!

From: tirvin@lmsc.lockheed.com
Message-ID: <3ivnpl$7cn@butch.lmsc.lockheed.com>
Source record: 94039

I've been reading about this language a lot recently in Atari circles.

If you don't mind, I'd like to ask a few question about it, since it seems to be rather popular among Atari developers, and I'd like to do a little recreational "on-the-side" 8-bit development:

What is ACTION! like? What other popular languages does it resemble? Is it very high level like Atari BASIC? Is it lower, similar to assembly? Maybe a "mid-level" language which can be used at a very high *or* very low level such as C?

If you regularly use ACTION!, what is it that you like about the language? Speed of code? Ease of development? The power of the language? Some combination of these or other factors?

How is with graphics? Communications? Databases?

I know it's a lot of questions, but by Atari software standards, the package ain't cheap. Of course, if it's *that* good, it may still be worth it. What have y'all to say?

Tim

Andrew, the copyright laws do not apply educational endevors. Probably could just say the sig is for passing information/education & IMO wouldn't violate the intent of the law. I have a couple of 5200's I bought for parts, what they did was completely eliminate the PIA chip & the Joysticks are read by the same scanning circuits the Pokey used for the keyboard. Ergo the odd ball controllers, they actually take the place of the 57 key keyboard. I haven't poke around a lot with the things, but apparently they don't really have a lot of I/O in the ROM, just a character set & a few primitive routines for reading the joystick/setting up the display. At the time the 5200 came out, my girlfriend's younger sister work in Atari Customer Service. She used to brag about stuff like how she could get people complaining about the lousy 5200 JS breaking to hang up by heaping abuse on them! Ah, the good old days when Atari was raking in billions. They were so sensitive to there customers <sic>.

Well, I've seen a 128K XEGS mod, but I don't actually have a writeup for
it. It didn't seem to hard, it just consisted of the mapper chip (out
of the 130XE) and extra RAMS (the ones in the GS are not the same as
the 65XE - the GS uses 64K x 4 bit devices). The only downside was that
the mod also disabled the internal missile command :(

If you have no luck anywhere else, I'll get the machine back off the guy
who has it, and do a description.

Pete

Arty; Action! compiles to the much faster code then anything short of assembler. It's a little tough to learn if you've only used Basic in the past, but if you're used to stuff like C or Pascal, it's a really not hard to pick up. For some stuff, like the generic block move routines, you'll find there's no measurable difference in speed. It does have some overhead since it calls everything via a JSR, but as long as don't do anything unusual like call the block move 8,000 times to move 8,000 bytes, it's generates good code. It has a best editor for programming I've ever seen, better then Turbo C, Turbo Pascal, Microsoft C or Basic(s), HiSoft Basic or Devpac on the ST. The code produced with Action! will run on any Atari & if you really need it in a cart, that can be done too. If you want to see an example of Action! code, just ask Bill for his /html/ reader. I think the language itself was done by Clint <something???> and Charles Marslett of MyDOS fame. Them boys really new how to write good code!
Rick

What is a Black Box? I was at a flea market a few days ago and
I saw something called the Black Box. It was really heavy, and seemed
to have some RS232 ports or something on the back. What is it?

TRANSPORTING
ATARI COMPUTER PROGRAMS
TO THE
5200

by Claus Buchholz

When Atari designed the 5200 "Supersystem" as a successor to
the aging 2600 VCS, they made use of the state-of-the-art
hardware they put into their 400/800 home computers. As a
result, the systems are quite similar. The differences are
great enough, however, that transporting programs from one
system to the other requires some effort.

The 5200 is a single-board machine with four controller
jacks, a cartridge slot, an I/O expansion connector and a
power/RF cable. It shares the same VLSI chips with the
400/800, except for the 6520 PIA (joystick/parallel I/O
ports). The other chips (ANTIC, GTIA, POKEY and the 6502
CPU) are in the 5200, although some of their registers are
in different memory locations than those in the 400/800.
Also, some of the registers serve slightly different
purposes. Figure 1 is a block diagram of the 5200. Let's
look at each section of the hardware in turn.

When a specific register is mentioned in the article, the
name is taken from the Hardware Manual in the 400/800
Technical Reference Notes. With the exceptions listed in
this article, the Hardware Manual applies also to the 5200.

6502 CPU.

Although it is a standard 6502 from the programmer's view,
Atari has reworked this chip to save four support chips.
Those four chips mediate access of the system bus by the
6502B and ANTIC in the 400/800, but that function is built
into the 6502C in the 5200. Atari also uses the 6502C in the
new XL series of computers.

16K RAM.

The 5200 contains 16K bytes of RAM addressed from $0000 to $3FFF, just as in an unexpanded 400. The memory circuit is nearly identical to that in the 400, except it uses 4516s, a 5V-only version of the 4116 16K-bit dynamic RAM.

The 5200 monitor program reserves locations $0000 through $0018 and $0200 through $021B for shadows and RAM vectors. And, of course, page $01 is reserved for the 6502 stack. The rest of the RAM is available to the cartridge program.

ANTIC.

This is the same ANTIC chip used in the 400/800. Since ANTIC shares the address bus with the CPU and has no chip select input, its registers reside in the same place in the 5200's memory as in the 400/800's, page $D4.

The 5200 has no System Reset key, so bit 5 of NMIST is useless and the 5200's interrupt handler ignores it.

GTIA.

The GTIA and its registers perform the same functions in the 5200 and 400/800, except as noted below. The registers, however, reside at page $C0 in the 5200's memory, not at $D0 as in the 400/800.

The trigger inputs, TRIG0 through TRIG3, are wired to the controller ports, one to a port. The bottom button on either side of the leftmost controller zeroes the TRIG0 register when pressed, and likewise for the other ports.

The bits in CONSOL, the 400/800's console switch port (START, OPTION, SELECT and speaker), are used as outputs in the 5200, Bit 3, the 400/800's speaker control can still be toggled in the 5200 to produce sounds through the TV speaker. Bit 2 controls the pots in the joystick controllers. It must be set high to enable the pots.

Bits 1 and 0 select which controller port is to be active at one time. 00 selects port #1 (the leftmost), 01 selects #2, 10 selects #3, and 11 selects #4. The trigger buttons and pots are independent of this selection; it applies only to the keypads and top side buttons on the controllers.

POKEY.

POKEY's registers are all addressed at page $EB in the 5200 as opposed to $D2 in the 400/800. Its functions are unchanged, however, except for two.

The eight pot inputs used for paddles in the 400/800 are wired to the 5200's controller ports, two to a port. Each

controller has an analog joystick, using one pot to sense horizontal position and a second pot for vertical position. The even pots (POT0-POT6) give the horizontal positions of range from 1 to 228; the maximum readings are to the right for the horizontal pot and at the bottom for the vertical pot. Figure 2 shows the pinout for the 5200 controllers.

Pin Function
1 Keypad -- right column
2 Keypad -- middle column
3 Keypad -- left column
4 Start, Pause, and Reset common
5 Keypad -- third row and Reset
6 Keypad -- second row and Pause
7 Keypad -- top row and Start
8 Keypad -- bottom row
9 Pot common
10 Horizontal pot (POT0, 2, 4, 6)
11 Vertical pot (POT1, 3, 5, 7)
12 5 volts DC
13 Bottom side buttons (TRIG0, 1, 2, 3)
14 Top side buttons
15 0 volts -- ground

The keyboard scanning lines in the 400/800 are used in the 5200 to read the keypad keys to the one controller that is selected by bits 1 and 0 in CONSOL. Only four lines are used, though, so only bits 1 through 4 of KBCODE are valid. Table 1 gives the keycode for each key on the controller. The top side buttons on the selected controller act like the 400/800 shift keys and also cause a BREAK-key interrupt, if that's enabled. Bit 0 of SKCTL, the debounce enable bit, need not be set in the 5200.

KBCODE
Key bits Keypad code
---
none 0000 $FF
0001 $0B
0 0010 $00
* 0011 $0A
Reset 0100 $0E
9 0101 $09
8 0110 $08
7 0111 $07
Pause 1000 $0D
6 1001 $06
5 1010 $05
4 1011 $04
Start 1100 $0C
3 1101 $03

2 1110 $02
1 1111 $01

POKEY's serial I/O lines are used in the 5200, but they are wired to the I/O expansion connector, an edge connector hidden behind a small door in the rear of the 5200. This connector allows for more hardware registers addressed at page $E0, and for peripherals using the serial port. See Figure 3 for the pinout of this connector. Its existence demonstrates Atari's original plans to expand the 5200 system.

ROM.

The 5200 has a 2K ROM on board which holds the character set and monitor program. The character set, which is an exact copy of the 400/800's set, resides at pages $F8 through $FB, and the monitor sits at $FC through $FF.

The cartridge ROM can be 32K bytes long and resides in memory from $4000 to $BFFF. Figure 4 shows the pinout of the cartridge slot. The two interlock connectors are wired together on a cartridge board. The 5200 uses this as a switch for the cartridge's power connections and as a Reset signal. Therefore, a cartridge may be safely removed or inserted while the 5200 is powered on.

The 5200 monitor program.

The 1K monitor program in ROM has three functions: (1) to initialize the system before running the cartridge program, (2) to service interrupts as they occur, and (3) to maintain shadows of some important hardware registers. Recall that the 400/800 Operating System is 10K bytes long and performs the above functions. It also provides peripheral handlers, predefined graphics modes, a screen editor, and floating point math routines. Those utilities do not exist in the 5200.

Table 2 shows the RAM locations used by the monitor for shadows and RAM vectors.

Table 2. 5200 Monitor RAM Locations.

Page Zero Locations
$00 Shadow for IRQEN
$01 Real time clock (high byte)
$02 Real time clock (low byte)
$03 Critical code flag (if non-zero, VBI routine is abbreviated)
$04 Attract mode timer/flag
$05 Shadow for DLISTL
$06 Shadow for DLISTH
$07 Shadow for DMACTL
$08-$10 Shadows for COLPMO through COLBK
$11-$18 Shadows for POT0 through POT7

Page Two Vectors
$200 Immediate IRQ vector
$202 Immediate VBI vector
$204 Deferred VBI vector
$206 DLI vector
$208 Keyboard IRQ vector
$20A Keypad routine continuation vector

$20C BREAK key IRQ vector
$20E BRK instruction IRQ vector
$210 Serial Input Data Ready IRQ vector
$212 Serial Output Data Needed IRQ vector
$214 Serial Output Finished IRQ vector
$216 POKEY Timer 1 IRQ vector
$218 POKEY Timer 2 IRQ vector
$21A POKEY Timer 4 IRQ vector

Upon Reset, the 6502 vectors through $FFFC to the initialization routine. This routine performs the following sequence.

1. Disable maskable interrupts, clear the 6502 decimal flag, and set the stack pointed to $01FF.

2. If the cartridge address $BFFD contains $FF, then jump immediately through the vector at $BFFE (diagnostic cartridge).

3. Zero all hardware registers and page $00, set CHBASE to point to the character set at $F8, and initialize the first six RAM vectors starting at $0200.

4. Set up the Atari logo rainbow display. The cartridge title (20 characters) and copyright year (2 characters) in ANTIC mode 7 display code are taken from cartridge addresses $BFE8 through $BFFD.

5. Enable VBI (Vertical Blank Interrupt) and DLI (Display List Interrupt), and enable key scan.

6. Wait four seconds, then jump through the vector at $BFFE to the cartridge program.

When the 6502 receives a non-maskable interrupt (NMI), it vectors through $FFFA to the NMI handler. The following steps take place:

1. Check NMIST and strobe NMIRES to reset the interrupt status.

2. If a DLI is pending, jump through the DLI vector (initialized to point to the rainbow effect routine).

3. If a VBI is pending, jump through the immediate VBI vector (initialized to point to the VBI routine).

4. Else, return from the interrupt (no System Reset).

A cartridge program can change these vectors to point to its own DLI and VBI routines, if it must. The default VBI routine takes the following action.

1. Push A, X, and Y onto stack, increment the real time clock, and update the attract mode timer.

2. If the critical code flag byte is non-zero, then pop Y, X, and A from the stack and return from the interrupt.

3. Update DLISTL, DLISTH, and DMACTL from their shadows.

4. Maintain the attract mode flag and update the GTIA color registers from their shadows.

5. Update the pot shadows from POT0 through POT7, and strobe POTGO to start another pot scan.

6. Jump through the deferred VBI vector (initialized to point to the end-of-interrupt routine, which pops Y, X, and A, and returns from the interrupt).

If maskable interrupts (IRQs) are enabled and one is received, the 6502 vectors through $FFFE to an instruction which jumps through the immediate IRQ vector. That vector is initialized to point to the IRQ routine, which performs the following tasks.

1. Push A and check IRQST.

2. For each of the eight bits in IRQST, check for a pending interrupt. If found, then clear the status bit, update IRQEN from its shadow, and jump through the appropriate IRQ vector.

3. If no interrupt found, then push X and check for a BRK instruction interrupt. If found, then jump through the BRK instruction IRQ vector.

4. Else, pop X and A and return from the interrupt.

The only IRQ vector that is initialized is the keyboard IRQ vector, which points to the keypad read routine. That routine does the following:

1. Push X and Y.

2. Read KBCODE and mask bits 1 through 4.

3. Convert to the keypad code given in Table 1, leaving that code in A.

4. Jump through the keypad routine continuation vector (initialized to point to the end-of-interrupt routine).

Comparing the 5200's monitor vectors to the 400/800's OS vectors, we see that Atari paid no attention to compatibility between the two. This further complicates the task of converting a program from one system to the other.

Transportability.

It would not be difficult, given the information in this article, to write a program in two versions, one for the 400/800 and another for the 5200. Nor would it be difficult, given the source code, to convert a finished program from the 5200 to the 400/800. The reverse is more difficult if the program takes advantage of special features in the 400/800 OS. Otherwise, the only task, aside from redefining some addresses, is to convert the keyboard/joystick input routines from one system to the other.

I acquired the information in this article by dissecting a 5200 and disassembling its ROM. The 400/800 schematics in the Hardware Manual were quite helpful. It is interesting to note the difference between the two machines and to guess Atari's motives for the design differences. But the similarities grossly outweigh the differences, so that a 5200 program can be developed and almost entirely debugged before testing on a 5200. With the addition of an EPROM burner, a 400/800 can be a powerful development system for 5200 programs. An adventuresome hacker can even bypass the EPROM by putting dual-port RAM on the cartridge board and downloading programs from the 400/800 development system into the 5200 for testing.

A.N.A.L.O.G. #16, February 1984

READER COMMENT

5200 Article Update. (ANALOG #15)

Newer releases of the 5200 incorporate some minor hardware changes. Controller ports 3 and 4 have been eliminated, making POT4 through POT7, TRIG2, TRIG3, and bit 1 of CONSOL useless. A few of the connector pins have been redefined. Pin 2 of the I/O expansion connector now carries POKEY's Audio Out signal. Three pins on the cartridge connector have changed to accomodate the new 2600 adapter. The system clock, 02, is output on pin 14, isolated through a diode. An alternate video input is taken from pin 24 and is also isolated through a diode. Pin 30 provides an alternate audio input.

There is space on the newer boards for circuitry for a PAL (European TV standard) version of the 5200. Also, on power-up, the monitor program checks for the PAL version by examining the GTIA register PAL after step 2 of the initialization routine. It also checks the cartridge program for PAL compatibility. The byte at $BFE7 should read $02 if compatible, or $00 if not. This is the only important change to the monitor program. There are some additional hardware changes, but none affects the machine's operation from the programmer's view.

There _is_ no Atari end of the SIO2PC. You just plug the cable in, load the software on the PC, and turn the Atari on. That's the beauty of it...you can load boot disks and everything.

Won't work. The 400 video circuit has terribly poor drive capability,
just enough to drive the RF modulator. Definitely not enough to power
a composite monitor directly (I tried). An article in ANTIC describes
how to kluge it up. Basically you recreate the 800's 4-bit D/A and
output amplifier, so it's not trivial, but doable.

I haven't been using my Old Faithful lately (1meg XE just blows it aside) but I wanted to check it out after a few months of storage under my bed.. I plugged it in, and it didn't work. Black-greenish screen, no sound, no attempt to boot the disk. Funny thing is, after 5 minutes in that state, doing a cold-start caused it to boot, but with no picture (with sound). A minute after that, I pressed System Reset and the video popped up. From that point on everything was normal. This process repeated itself a week later.

Why does this happen, and what component inside is worn out?

But! I wonder about the actual license to make the game. I think rights had to by purchased from Nintendo. For every *video game* of the era, the carts were all made by Coleco, who made the best bid. However, as far as I know, the Atari 400/800 was the only *computer* to get the game. Then, the fact that (as mentioned above) most 400/800 games were modified for 5200, I wonder if they were allowed to "fudge" a 5200 version...despite it's being a "video game" of which the rights to DK would have been to Coleco. Perhaps there NEVER WAS a DK for the 5200.

The 5200 is probably the only Atari system that I really don't care if I own. The games are all the same as the 8-bit computer (although fewer) and (as mentioned above) the controllers break. I remember being at the Atari store (in Alaska - when there WAS an Atari store) and seeing large stocks of 5200 controllers sell out.

The idea to make the 5200 incompatible must have been under the James Morgan regime at Atari. Rather than innovation that you'd imagine the engineers to come up with, it seems they were likely told to make it that way by some marketing beancounters in suits. Ha ha! They never envisioned the XE Game System....which is sort of like the 5200 done right, albeit 5-6 years too late.

Any opinions on the XE Game System? I remember seeing it for sale in Costco years ago. I got excited when I saw the box. I thought it was some new hybrid of the 7800 with Atari 8-bit capabilites. Then I saw all the pictures onthe box - the same games I'd been playing since '82!! Don't get me wrong...I still love 'em -(have 2 of 'em (XEGS)).

Well...I'm getting a little off topic here, but what about the 7800? How much of the guts of that thing are 400/800/XL?? I think there's a "Maria" chip in there that allows for (something on the order of) 100 sprites. Does this have better graphics or sound? I've been told that the best versions of the Lucasfilm Games (Ballblaster, etc) are on the 7800. I wonder why that is. I've never played a 7800, but the screen shots I remember seeing in advertising looked just like Atari8 screens.

Now off the topic a little more.... I read once that Atari was contemplating a "ST Game System" - to be packaged and marketed almost like the XEGS. They decided it would hurt the image of their computers and shelved the idea. They did have a 520ST "Game Package" however. Came with a 520ST with RF output and a pack in of several disk games...and a colorful box with screen shots of many games. Too bad for the ST that they didn't make a STGS...perhaps there would have been some ROM games for the ST...but that's where the good ol' Atari8 fills the void!

>simplified the levels. :(

They also screwed up the entire game. DONKEY KONG on the Gameboy is -NOT-
a port of the arcade game; it's a new-fangled puzzle thingamaboobit. The
first four stages look like the old levels, but after that you get a totally
different game.

Feh. I would have bought a Super GameBoy if this was the arcade DK, but it
ain't, so I didn't...

: with Assembly, C way below that (heheh) and TXBL and Action! up at the top

But that is a personal thing. I would put C at the top in my benchmark,
next Assembly, and maybe BASIC at the bottom, the rest I wouldn't use, why?

Because I never had, that's why they are so difficult and not easy to use for
me. I don't really care for Action!, it looks like somebody tried to mix
BASIC, Pascal, and C all into one. (I don't like Pascal, and haven't used
BASIC in so long I couldn't remember how). <sigh> It makes you wonder,
is one really learning new stuff, or are they just replacing the new stuff
over the old? Hmm. It's not like I am remembering BASIC.

1816. SIO2PC as nullmodem

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-01 04:49:13 UTC
From: James King <jeking7@delphi.com>
Message-ID: <xO74V+Z.jeking7@delphi.com>
Source record: 94050

Somebody suggested that the SIO2PC would work like a null modem cable.

Tried it today without any luck. It'll work for TEXT messages back
and forth, but the moment I try to xfer a file(s) from my PC to the
8bit, I get a NO CARRIER message, and the PC's software indicates OFFLINE.

Apparently, the CD connections arent made, so the PC doesnt know a
connection exists..

Anybody else out there have this problem?

Everything else works great!

Today, called Bob Klaas of K-Products (owners of BBS Express Pro! and the KPI Hard drive interface (formerly Supra), and was dismayed to learn that he's pulling out of the 8bit Atari arena and going "where the money is at" to the PC market.

Was unable to convince him to stay with the 8bit Atari as a hobby, which I thought it was to him, and talk him into doing one final ram upgrade on my XL!

As many times as Bob Klaas and I have fought over the last 10 years, it's sad to see him go, but from a business perspective, I can understand.

Glad that it's just a hobby/passion to me - and not a means of income!

Speaking of passion! Went to my local mall today and had a custom license plate holder made (for my Iroc Z-28 Camaro) that reads:

Top of Plate: Atari! 8-bit Power!!
Bottom Plate: Internet: jeking@xmission.com

Is that cool or what? [grin]

From: James King <jeking7@delphi.com>
Message-ID: <xs8bVUf.jeking7@delphi.com>
Source record: 94052

What's the absolute BEST ram upgrade for the 800xl that provides
not only 512k ram but FULL XE compatibility as well - and is fairly
easy to do.

I can solder and do almost all hardware hacks myself, but SUCK
at desoldering chips - as I end up holding the desoldering tool
too long and burn the board.

Any recommendations, schematics, etc.. greatly appreciated!

Guess I'll have to do this final ram upgrade myself.

[just finished adding SuperVideo and SuperAudio to every 8bit computer
I own (130xe's, 800xl's, 65xe's and one 600xl (what a pain!))

Subj: Mods for the 8-bit

I just got a post from a gentleman on Delphi telling me of a book he has called "Mods, Fixes and Upgrades" for the 8-bit. It was published in August of 1987 by the Midwest Atari Group, Iowa chapter, the Editor was Gordie Meyer. Sounds like a must have. Does anyone know where I can find this tome of knowledge or how to contact Gordie Meyer? I really want to read this.
I am also going to attempt to get a 2.5" IDE 43 meg HD INSIDE of my 1200XL. I understand this has been done (by Bob Wooley) and probably released as an article in the SLCC journal. Does anyone have this article? I would GREATLY appreciate any help on this!
Thanks for any and all help!

Tim Irvin (tirvin@lmsc.lockheed.com) wrote:

: What is ACTION! like? What other popular languages does it resemble?

ACTION! is similar to a simple 'C'. It has similar block consructs, i.e. IF THEN ELSE, DO WHILE, FOR, etc. It also supports the basic unsigned types of BYTE (8bit) CARD (16bit), and the signed type of INT (16bit). ACTION! supports POINTERS, ARRAYS, and RECORDS (user defined structures).

A big difference between ACTION! and C is that C in naturally reentrant. If you are familiar with 'local' variables in C, you know they go on the stack. In ACTION!, a 'local' variable gets assigned a to a location in memory (like a 'static' variable in C). Depending on what you want to do, this is either something to take into consideration, or nothing to worry about.

: If you regularly use ACTION!, what is it that you like about the
: language?

The reasons I use ACTION! - 1) It produces executable code, 2) It is easier than assembly, 3) With the Run Time Package I can produce ROMable code.

: How is with graphics? Communications? Databases?

You can do all of this with ACTION! ;^)

Very cool, and so is the car. I have always loved the Z-28, my favorite
small block chevy. My favorite was the 69 ( 302 engine, small throw on the
crank to let it rev, 4 bolt mains, Muncie M22 rock cruncher 4 speed,the 4
wheel disk option and the much coveted but rare dual cross ram induction
system with a pair of 650 cfm Hollies. Very nasty machine. And the gauges on
the center console were VERY cool.)

Source record: 93982

That's absolutely amazing. The Atari 8-bit was my first computer (the 400 I believe it was called), and then eventually I bought the 130XE. Of course now I'm using an IBM 486 clone DX2/66, but I still keep all of my Atari 8-bit games in the closet (I didn't erase any of the zillion disks full of software I had collected).

Anyways, does anyone know of a program which would allow one to read Atari 8-bit files in an IBM disk drive (for storage purposes)?

In cleaning out all my old Atari stuff for sale, I happened on my old Karatika. I showed my daughters, who thought it was 'way coooool', until they tried it. I never DID finish. Can someone give me a few tips. It took me an hour to get good enough to just get into the building, and the second encounter with the falcon did me in. I can't find the docs (I don't even remember getting them... I got the disc used with a ton of magazines & books some time ago from a friend getting out of Atari, perhaps I'm not even using the joystick right), and I don't know how to change levels. I just keep getting weaker... and weaker... and...

YUP....but The 400/800/XL/XE version has all four screens (including
Mudpies) and they are all great!!

Sorry I am not well informed about programming. However, as the other
state, what games I've played that advertised being written in Action -
were FAST!!!

Y'all remember the software package "HomePak" from Batteries Included?
It was available in Atari XL/XE and Commodore 64 versions (perhaps
others, too). I think it was by Russ Wetmore. It was a combination
database, word processor, and terminal program. I don't think it did
either too well. Anyway, the Commodore 64 version was written in
Action! on the Atari! Pretty strange, huh?

I was at an electronics surplus store in Portland last weekend (HUGE
place with everything a guy could want). I saw something called a "Black
Box" that was a huge, ugly serial contrivance. Believe me, that's not
the "Black Box" that we talk about here on the Atari forums....if we saw
the same thing. That Black Box looked like junk!!

The Atari Black Box is flat, and shaped like the letter "T" (sort of).

James

1838. Re: different graphic modes in the same scanline

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-01 15:12:23 UTC
From: CONRADUS@PLEARN.EDU.PL
Message-ID: <199503011512.JAA29495@mail.cs.utexas.edu>
Source record: 93962

The trick used by Our5oft is very simple:

1) we are waiting for desired scanline
2) then we use some NOP's as delay into scanline
3) we are swichting on the GR.9 using GTIACTL (called GPRIOR) register
4) then we use some NOP's again
5) then we are switching GTIA back to the GR.8 (in the same scanline)

The GTIA-chip becomes "stupid" and produces GR.15.

1839. 165 error code?

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-01 17:13:35 UTC
From: chaos@oo.com
Message-ID: <3j29vv$1ih8@tequesta.gate.net>
Source record: 93963

Greetings people,

Hmm, i have a little problem here. On the local 8bit bbs in my area, i found an arc'd file with a buch of memory upgrades. [as some of you may recall, i was looking for memory upgrades for my xegs] anyways i un arced the files, and the file i need is called this,

065xe130.mem

Now, if i try to copy it to the screen (e:) or to the printer, or even to try to rename the damn file, it gives me an 165 error..[the manual says the 165 error is illegal charater for a file name]

is this because there is a 0 in front of the file name? how do i view this sucker?

ah well, mail me if any of yall know. latez.

Source record: 93964

How was a C=64 program written in Action!?

Well, I can understand how, I guess; seeing as it's all 6502, but were there some sort of OBJects which emulated C= stuff (gfx/key/etc)?

WIERD!

I don't believe you! :)

Je> Ledbetter went 100% PC. I doubt you'll ever see a PC version
Je> of BBS Express PRo! as there are already too many packages
Je> out there.

I was just wondering if he ever released a version of it for the PC even
if doesn't compare with today's packages.

Je> An ST version was created and it went nowhere. The new owners
Je> of Pro! are having a tough enough time holding onto the 8bit
Je> version.

I know I own the ST version. ICD never supported it the whole time I
used it. That's why it went nowhere.

You can try doing a RAW rename on it:

ie:

RENAME "D:?65XE128.ARC,A65XE128.ARC" in TurboBASIC

DOS interfaces may be pissy about it.

You could of course use Atari DOS 2.0/2.5 which ALLOWs numbers in the beginning.

1843. Re: SIO2PC on a 12meg 486

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-01 17:40:10 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <133903@cup.portal.com>
Source record: 93967

Ben: Mike @ FTE gave Nick Kennedy a SDX cart, I assumed to get compatibility problems licked, but no news. It seems to work fine with drive D1:, but anything else & I have problems. It not to bad since I can just switch logical drive numbers on the clone, but it would be nice. I guessed the problem is SDX tries to switch high speed everytime it accesses a drive. By the time the clone's serial port recovers from the command or different baud rate, it misses the next command & times out. I don't think you can disable the SIO.SYS file in the SDX & still have it work. Would be nice to test out the theory though. There's other problems that I have trouble with, like trying to mix MyDOS directories with SD, but that's with any drive.
Rick

It's funny you say:

"it looks like somebody tried to mix
BASIC, Pascal, and C all into one."

because that's exactly what they did!

Trust me, for the speed, Action! is well worth putting up with "something
that looks like Pascal." :) I think C looks like Pascal! :) I think
Action! looks like C. I guess that makes it that I think Action! looks
like Pascal. :)

I hate semicolons();

Other Documents of Interest
14.1) What vendors, developers, or publishers support the 8-bit Atari?
14.2) Where is my nearest 8-bit Atari BBS?
14.3) Where is my nearest 8-bit Atari user group?
14.4) How do I use my new or emulated Atari?
14.5) What prominent Atarians are reachable by e-mail?

Subject: 1.1) What is an Atari 8-bit computer?

In order of their release, the Atari 8-bit computers include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System. The 400/800 models were first shown publicly in November 1978 and first sold in 1979. The final machine, the XE Game System, was released in 1987. Atari Corp. officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

The following text was written by Chris Crawford and appears in De Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc., 1981-1982. It has been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM, ROM, and a (PIA). However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari

engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

ANTIC is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

GTIA is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missle graphics, and collision detection.

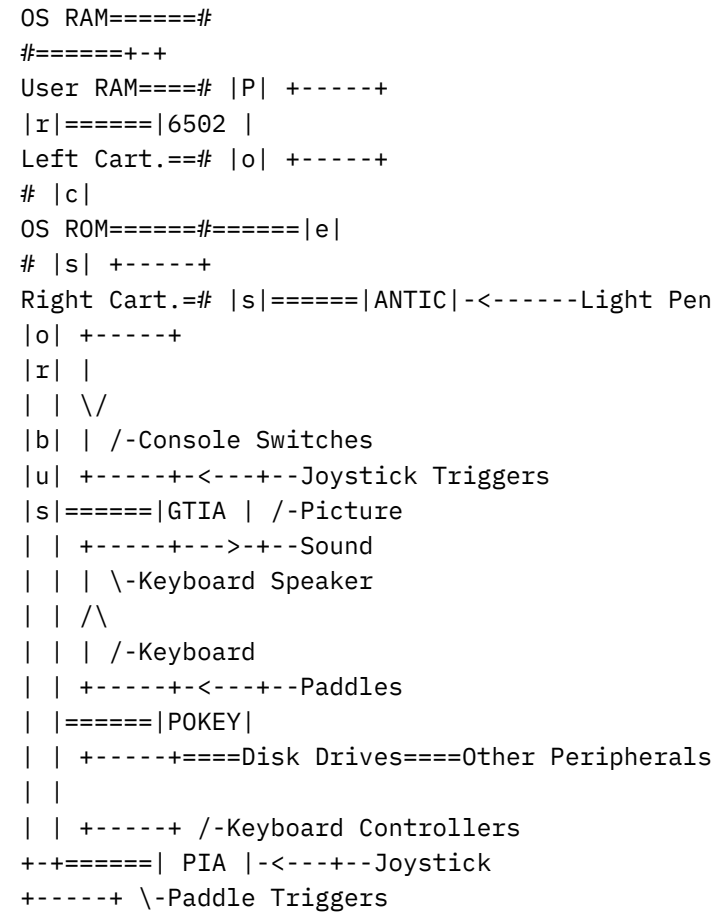
POKEY is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The 130XE and XEGS contain a small additional LSI called FREDDIE. According to mailto:masstorage@closer.brisnet.org.au (Masstorage), "Freddy is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. Freddy also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a freddy but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from freddy, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to freddy for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say freddy does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO freddy) and an extra 8 RAM

chips."

Hardware Arrangement



Beginners at using the 8-bit Atari platform may wish to contact Bill
Kendrick, mailto:kendrick@sonoma.edu, for his Newbie/Emulator FAQ.

The following is taken from Bill's Newbie/Emulator FAQ.
Graphics:
The Atari has maximum resolution of 320 x 192 (standard, non-overscanned
screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4,
160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also
supported. 40 x 24 x 256-character (128 normal, 128 inverse, character
set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allowed,
the other 128 characters have 4th changed into a color 5) and
40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only,
and 80 x 192 x 9 color screen modes.
Graphics Modes Summarized:
Mode Horiz.xVert.xColors text/graphics
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text

3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 4 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Normal (bordered), narrow (underscanned), and wide (overscanned) screen modes are available.
Screen modes can be mixed (by lines) down the screen using the Display List (a program which is executed by the ANTIC graphics chip every screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.
All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

Sound:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

[I'd like more system spec's here.]

Subject: 2.1) What is comp.sys.atari.8bit?

If you have Usenet newsgroup access you can access this discussion group through news:comp.sys.atari.8bit. This is an unmoderated newsgroup for discussion about the 8-bit Atari 400/800/XL/XE computing platform. All postings to news:comp.sys.atari.8bit automatically appear in the Info-Atari8 Digest and in INFO-A8.

comp.sys.atari was split into comp.sys.atari.8bit and comp.sys.atari.st in approximately 1986. To the best of my knowledge, there is no charter for comp.sys.atari.8bit, presumably because the custom of drafting charters for new newsgroups did not exist at that time.

news:comp.sys.atari.8bit is archived by the INFO-A8 listserv.

Subject: 2.2) What is comp.sys.atari.announce?

news:comp.sys.atari.announce is the moderated Usenet newsgroup for news items and announcements related to all Atari computing platforms. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari announcements. Moderated by Yat Siu from mailto:lexicor@world.std.com

----

Subject: 2.3) What is comp.sys.atari.advocacy?

news:comp.sys.atari.advocacy is the unmoderated Usenet newsgroup for advocating for or against the various Atari computing platforms. If you enjoy making comparisons between Atari 8-bit and other computing platforms, this is the place to do it.

Subject: 2.4) What is comp.sys.atari.programmer?

news:comp.sys.atari.programmer is the unmoderated Usenet newsgroup for topics in programming on the various Atari computing platforms, including the Atari 8-bit.

Subject: 2.5) What is comp.emulators.misc?

news:comp.emulators.misc is the unmoderated Usenet newsgroup for the discussion of emulating computing platforms on other computing platforms. All emulator discussion that does not involve the Apple][, the Commodore 64, or the WINE MS-Windows emulator (which each have their own emulator groups) may be found on news:comp.emulators.misc.

Subject: 2.6) What is comp.emulators.announce?

news:comp.emulators.announce is the moderated Usenet newsgroup for news items about emulating one computing platform on another. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari emulator announcements. The moderator may be contacted at mailto:emulators-request@qualcomm.com

----

Subject: 3.1) What is the Info-Atari8 Digest?

If you have Internet e-mail access you can access this discussion group through the Info-Atari8 Digest.

The Info-Atari8 Digest originates from

mailto:atari8@netcom.com

Subscription requests should be sent to the above address with the subject:

SUBSCRIBE | UNSUBSCRIBE (that is, one or the other)

The first line of the body of the letter should be the person's full name followed by his/her mailing address. For example:

Mike Todd snyder10@convex1.tcs.tulane.edu

To contribute to discussion threads in the Info-Atari8 Digest, send your posting to mailto:comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on news:comp.sys.atari.8bit and in INFO-A8.

Note that any posting sent to mailto:atari8@netcom.com will NOT be cross-posted to news:comp.sys.atari.8bit. The Moderator is presently working to correct this.

The Info-Atari8 Digest is archived by the INFO-A8 listserv.

Recent copies are also kept at ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jason Duerstock.

The Info-Atari8 Digest Moderator is Mike Todd, mailto:snyder10@convex1.TCS.Tulane.EDU

Subject: 3.2) What is INFO-A8?

If you have BITNET or Internet e-mail access you can access this discussion group through INFO-A8.

The BITNET subscription commands are:
tell listserv at marist register <your real full name>
tell listserv at marist subscribe info-a8

The Internet subscription command is:
mailto:listerv@vm.marist.edu, message says
subscribe info-a8 <your real full name>

To contribute to discussion threads in INFO-A8, send your posting to mailto:comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on news:comp.sys.atari.8bit and in the Info-Atari8 Digest.

Any postings sent to mailto:info-a8@vm.marist.edu or to INFO-A8@MARIST will not reach news:comp.sys.atari.8bit, so don't send your postings there.

You may leave the list at any time by sending a "SIGNOFF INFO-A8" command to LISTSERV@MARIST, or by sending a message to mailto:listserv@vm.marist.edu that says "unsubscribe info-a8". Please note that this command must NOT be sent to INFO-A8@MARIST nor to mailto:info-a8@vm.marist.edu.

The archive of comp.sys.atari.8bit, the Info-Atari8 Digest, and INFO-A8:

You can obtain a list of the available archive files by sending an "INDEX INFO-A8" command to LISTSERV@MARIST or by sending a message to mailto:listserv@vm.marist.edu that says "index info-a8". These files can then be retrieved by means of a "GET INFO-A8 filetype" command, or by using the database search facilities of LISTSERV. Send an "INFO DATABASE" command for more information on the latter.

Recent copies are also kept at ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jason Duerstock.

The INFO-A8 Moderators are:
HARRY@MARIST (A Harry Williams)
mailto:ravi@mcnc.org (Ravi Subrahmanyan)
mailto:billw@score.stanford.edu (Bill Westfield)

INFO-A8 was created on December 9, 1986.

Subject: 3.3) How can I access the Merit/UMich Archive by e-mail?

For more information on the Merit/UMich archive, see the section of this FAQ list on accessing this archive by FTP.

Downloading - BART

Brode's Archive Retrieval Thang - the Merit/UMich Archive e-mail file server

To learn about using BART to access the Merit/UMich Archive, send e-mail to: mailto:atari@atari.archive.umich.edu. The subject of the message doesn't matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes), try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the Internet) and splits up large files into parts of about 30K or less.

Uploading

Simply uuencode the file, (please split it into parts of 60 K or less) and mail the result to mailto:lenn@atari.archive.umich.edu. Please name

the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.

Subject: 3.4) How can I retrieve files from FTP sites by e-mail?

There are several general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet.

1) mailto:ftpmail@decwrl.dec.com with no subject line, and two-line
body with line 1 help and line 2 quit

2) mailto:ftpmail@grasp.insa-lyon.fr (body: help) Please, European
users only.

3) mailto:bitftp@pucc.princeton.edu (body: help or ftplist for a
list of anonymous ftp sites)

4) mail BITFTP@DEARN or to mailto:BITFTP@vm.gmd.de (body: help or
ftplist for a list of anonymous ftp sites) (Europe only)

Subject: 3.5) How can I post to Usenet newsgroups by e-mail?

There are a several 'public' mail/News gateways. Each one has their own
ways for addressing syntax. The three most common ones are:

Site: cs.utexas.edu
Syntax: newsgroup-name@cs.utexas.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp-sys-atari-8bit@cs.utexas.edu

Site: newbase.cs.yale.edu
Syntax: newsgroup.name-news@newsbase.cs.yale.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit-news@newsbase.cs.yale.edu

Site: decwrl.dec.com
Syntax: newsgroup.name@decwrl.dec.com
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit@decwrl.dec.com

Mail-to-news gateways of this sort tend to be overloaded.
Therefore, please do not use these gateways or any other similar
gateways if you can post to Usenet directly.

Subject: 3.6) How can I access the World Wide Web by e-mail?

Swiped from the WWW FAQ, which is maintained by mailto:boutell@netcom.com
(Thomas Boutell), here is how to access a web page by email:

mailto:server@mail.w3.org (preferred) or to
mailto:listserv@info.cern.ch (older address) containing
the following single line. (What you put on the subject line doesn't
matter; blank is OK. This line should go in the text of the message.)
You will receive as a reply a simple page intended to help you learn
more about the Web.

send http://www.earn.net/gnrt/www.html

Subject: 4.1) How can I access the Merit/UMich Archive by FTP?

The Merit/University of Michigan Software Archives hold a huge number
of files for many computing platforms, including the Atari 8-bit
computers. Our 8-bit Atari Archivist is Jody Lenn,
mailto:lenn@atari.archive.umich.edu; the Atari Archive as a whole is
maintained by Mickey Boyd, mailto:boydm@atari.archive.umich.edu.

The convention for Anonymous FTP sites is to accept "anonymous" as your
username, and your e-mail address as your password. All of the
FTP sites mentioned in the FAQ list follow this convention.

Downloading (Try the site nearest you first)
---
a) ftp://atari.archive.umich.edu/atari/8bit (141.211.120.11, United States)

b) ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit
(128.252.135.4, United States)

c) ftp://src.doc.ic.ac.uk/computing/systems/atari/umich/8bit
(146.169.2.10, United Kingdom)
d)
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit
(129.69.8.13, Germany)

e) ftp://ftp.orst.edu/pub/mirrors/archive.umich.edu/atari/8bit
(128.193.4.2, United States)

f) ftp://barnone.citi.umich.edu/afs/umich.edu/group/itd/archive/atari/8bit
(141.211.128.22, United States)

g) ftp://phlem.ph.kcl.ac.uk/pub/Atari8bit (137.73.4.24, United Kingdom)

h) ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
(147.70.146.36, United States)

Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

Uploading

Place uploads in ftp://atari.archive.umich.edu/atari/8bit/New

No uploads may be made to the Archive's mirror sites.

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivist will be sure to place
it in an appropriate permanent directory.

Note that the 8bit/New directory is "write-only."

Newly uploaded items may be found in the 8bit/Newitems subdirectory.

Subject: 4.2) What is the Boston Archive?

Here's an 8-bit Atari FTP site located at Boston University. It is
maintained by Adam Bryant, mailto:adb@albert.bu.edu. This site seems to
have seen no uploads for years, but there are some files here that aren't
on any of the other sites.

ftp://cs-ftp.bu.edu/PC/ATARI (128.197.13.20)

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by Eyvind Bernhardsen,
mailto:eyvind@lise.unit.no. PVV stands for ProgramVareVerstedet, or The
Software Workshop, a student society at the University of Trondheim, Norway.

ftp://nova.pvv.unit.no/pub/Atari/8bit (129.241.36.207)

Uploads go to ftp://nova.pvv.unit.no/incoming/atari/8bit; Eyvind moves
them to the appropriate directory. Please include a .readme file with
each upload, so people know what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

This smallish 8-bit Atari FTP site is maintained by Kevin Atkinson,
mailto:kevina@clark.net.

ftp://ftp.clark.net/pub/atari (168.143.0.2)

Write to Kevin for uploading instructions.

A mirror of the ClarkNet Archive, kept by Jason Duerstock:
ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari 8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the Closer To Home Archive?

Here is a fairly large FTP site in Australia kept by mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears).

ftp://closer.brisnet.org.au/pub/archive1/8_bit (203.4.149.97)

Support site for James Bradford's Super 8-bit Products including SuperDos, SuperRam, Super800<->XL and much more.

Uploads go in ftp://closer.brisnet.org.au/pub/incoming

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

The Cleveland Free-Net is the hub system of the NPTN, the National Public Telecomputing Network. It can be accessed by any of the following: telnet://freenet-in-a.cwru.edu, telnet://freenet-in-b.cwru.edu, or telnet://freenet-in-c.cwru.edu (129.22.8.32 or 129.22.8.51).
Type "go atari" to reach the Atari SIG.

Those who add their names to the Atari SIG user directories are automatically members of the official Atari user group C.A.I.N. - Central Atari Information Network.

The Cleveland Free-Net Atari SIG publishes the CAIN Newsletter, maintains the CAIN Home Page on the WWW, and keeps the "Who's Who in the Atari Community E-Mail Directory" listing. Send correspondence and press releases to mailto:xx004@cleveland.freenet.edu.

Subject: 5.2) What is the Youngstown Free-Net Atari SIG?

Youngstown Free-Net (Youngstown, Ohio USA)
telnet://visitor@yfn.ysu.edu (192.55.234.27)

Type "go atari" to reach the Atari SIG. Write to mailto:xx140@yfn.ysu.edu for more information.

Subject: 5.3) What is the National Capital Free-Net Atari SIG?

National Capital Free-Net (Ottawa, Canada)
telnet://guest@freenet.carleton.ca (134.117.1.25)

Type "go atari" to reach the Atari SIG. Write to Christopher Browne at mailto:aa454@Freenet.carleton.ca for more info.

Subject: 5.4) What is the Closer To Home BBS?

Kept by mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears), this is a BBS in Australia which supports the 8-bit Atari.

telnet://guest@closer.brisnet.org.au (203.4.149.97)

Subject: 5.5) How can I access the World Wide Web by Telnet?

This section swiped from the WWW FAQ, which is kept by mailto:boutell@netcom.com (Thomas Boutell).

An up-to-date list of these is available on the Web as http://info.cern.ch/hypertext/WWW/FAQ/Bootstrap.html and should be regarded as an authoritative list.

telnet://telnet.w3.org
A telnettable browser provided by the W3 coalition.

telnet://www@www.cc.ukans.edu
Offers Lynx, a full screen browser which requires a vt100 terminal. Log in as www. Does not allow users to "go" to arbitrary URLs, so GET YOUR OWN COPY of Lynx and install it on your system if your administrator has not done so already. The best plain-text browser, so move mountains if necessary to get your own copy of Lynx!

telnet://www@www.njit.edu
(or telnet 128.235.163.2) Log in as www. A full-screen browser in New Jersey Institute of Technology. USA.

telnet://www@www.huji.ac.il
A dual-language Hebrew/English database, with links to the rest of the world. The line mode browser, plus extra features. Log in as www. Hebrew University of Jerusalem, Israel.

telnet://sun.uakom.cs
Slovakia. Has a slow link, only use from nearby.

telnet://www@info.funet.fi
(or telnet 128.214.6.102). Log in as www. Offers several browsers, including Lynx (goto option is disabled there also).

telnet://www@fserv.kfki.hu
Hungary. Has slow link, use from nearby. Login is as www.

Subject: 6.1) How can I retrieve files from the Merit/UMich Archive through Gopher?

The Merit/UMich Archive has a native Gopher server. Try

gopher://gopher.archive.merit.edu:7055/11/atari/8bit

to connect directly to the Merit/UMich Archive's 8-bit Atari directory. I personally recommend this method for downloading from the Merit/UMich Archive.

There are also several mirror archive sites with Gopher servers:

gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit

gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit

gopher://gaia.ucs.orst.edu:70/11/g-i-s/computer/zftparea/mirrors/archive.umich.edu/atari/8bit

---

Subject: 7.1) What WWW pages support the 8-bit Atari?

Subject: 7.8) How can I access the Merit/UMich Archive by AFS?

Downloading

Just cd /afs/umich.edu/group/itd/archive/atari/8bit
[What is the propsero:// URL for this?]

Uploading

Just cp the file into /afs/umich.edu/group/itd/archive/atari/8bit/New
[What is the propsero:// URL for this?]

Subject: 7.9) What is #Atari8?

There is a channel on Internet Relay Chat for 8-bit Atari users. Its
name is #Atari8. Join #Atari8 on port 6667 (EFNet) and enjoy (if you
meet somebody there).

There should be a small bot called XE_BOT on this channel. While on
channel #Atari8 use the command
/msg XE_BOT help
for more information.

The latest information on #Atari8 and the XE_BOT may be found here:
http://www.uci.agh.edu.pl/student/robo1grp/tatar/public_html/Atari/irc.html

Channel #Atari8 and the XE_BOT are the work of Tomasz Tatar,
mailto:tatar@student.uci.agh.edu.pl.

Subject: 8.1) What is the CAIN Newsletter?

The Central Atari Information Network Newsletter is the monthly online
magazine of the Cleveland Free-Net Atari SIG. The editor is Mark
Leair of the Atari SIG. 8-bit computers support is provided by Michael
Current and Craig Lisowski. For information, write to the Atari SIG at
mailto:xx004@cleveland.freenet.edu.

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
Merit/UMich: Archivers/uudecode.bas, Archivers/uudecode.doc
Boston: comm/uudecode.lst, comm/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
Merit/UMich: Archivers/yau.arc
Boston: comm/yau.uue, comm/yaue.uue, comm/yau.doc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
Merit/UMich: Utilities/uue.arc

Dumas UU-coder by John Dunning - should work w/BART-style split files.
Merit/UMich: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that is common in the MS-DOS world. This is done to make the file shorter, so it takes up less space on your disk and it takes less time to transfer between computers. The archives contains several 8-bit Atari archivers fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
Merit/UMich: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc
Boston: {comm,util}/superarc.uue, {comm,util}/superarc.doc

Subject: 9.3) Okay, how about a .dcm file?

A .dcm file is a format unique to the 8-bit Atari which is used to convert entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff.
Merit/UMich: Archivers/dskcom32.arc or Archivers/diskcomm.arc (same thing!)
Boston: {util,comm}/diskcomm.uue

Subject: 9.4) What is an .xmo file?

.xmo stands for XMODEM. The idea was that the file was not plain text, but was a binary file. As a binary file, it had to be downloaded using a file transfer protocol such as XMODEM. The use of ".xmo" as a filename extender was popular once, but has been discouraged for years.

Subject: 10.1) What 8-bit Atari emulators exist for other computing platforms?

These are the emulators that are usable.

1) ST Xformer 2.55, from Branch Always (see companion Vendor/Developer List for complete contact info). A freeware 8-bit Atari emulator for the Atari ST.

Merit/UMich: /atari/Emulators/stxf255.lzh

2) PC Xformer, from Branch Always (see companion Vendor/Developer
List for complete contact info). The 8-bit Atari emulator for
DOS/Windows/OS/2. Versions 2.0 and 2.5 are freeware; 3.0 is the commercial
version.

The following further info on PC Xformer provided by Bill Kendrick,
mailto:kendrick@sonoma.edu. Contact him for his Newbie/Emulator FAQ.

2.0 emulates an Atari 800. It requires about 300K of
free memory, 320x200x256 (MCGA/VGA/SVGA) graphics, and a 286 CPU.
It does not support ROM files, disk image swapping within the
program, player/missile graphics collision detection, sound,
PC joystick support, modem/printer support, but is free.

2.5 is the replacement for 2.0. It emulates either an Atari 800
or an Atari 800XL. It requires about the same as 2.0. It does
support ROM files and the PC speaker is used to emulate the old
Atari 400/800 internal speaker clicks. It is also free.

3.0 is the first commercial release. It emulates an Atari 800,
800XL, or 130XE (128K RAM; I heard it was to do 320K but I think
that was reduced). It requires a 386 and 512K of memory. It
supports Sound Blaster, player/missile graphics collision detection,
modem/printer and PC joystick support. It
comes with a disk with the software, an ammendum to the printed
documents, and a bunch of Atari 8-bit software (example programs:
demos/games, and a few useful utilities). It supports disk swapping
through a (currently) simple menu.

All versions support .XFD (Xformer disk) format disk images, and
all versions of PC Xformer support SIO2PC disk images (.ATR's).

PC Xformer 3.0 comes with a 36-page printed manual and reference.
It includes appendicies explaining graphics, sounds, colors, BASIC,
subdirectory paths (for MSDOS which in turn explains SpartaDOS/MyDOS),
a quick keyboard reference, ATASCII characters (all 128 drawn out),
the Atari editor, error codes, file IO (commands, devices, XIO calls)
as well as giving breif information on how to contact other Atari
users, common file extenders, and it includes a LARGE glossary
explaining Atari BASIC / TurboBASIC XL commands, Atari computer
terms, and general computer terms.

Merit/UMich: Xf2/xf2.zip, Xf2/xf25.zip

Of importance to PC Xformer users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into
SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

BobTerm 1.22, shareware by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; excellent for BBSing
Merit/UMich: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
Merit/UMich: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Combination VT100, XMODEM, Kermit; buggy at file Xfers
Merit/UMich: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Excellent at VT100 on the XEP80; 1200bps top speed
Merit/UMich: Telecomm/vt850b1.arc

FlickerTerm 80 0.37, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus

Merit/UMich: Telecomm/ft80v037.arc

Ice-T 1.0 by IceSoft (Itay Chamiel)
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: XMODEM download
Autodial: No
Backscroll buffer: yes (One screen)
Capture-to-disk: No
Summary: Excellent for high-speed VT100 emulation
Merit/UMich: Telecomm/icet.arc

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
Merit/UMich: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
Merit/UMich: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
Merit/UMich: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett and Mark Vallevand - The latest version!
Merit/UMich: Diskutils/myutil.zip
PVV: utilities/disk/myutil.zip

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
Merit/UMich: Xf2/anad207.zip, Xf2/anadisk.txt
Deana by Nate Monson - converts AnaDisk dump files from Atari format
Merit/UMich: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:preston.f.crow@dartmouth.edu,
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050 drive or equivalent. Very limited.
Merit/UMich: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 12.4), can be used to read/write to a hard drive connected to an MS-DOS system. This can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the companion vendor/developer list) allow the Atari XF551 disk drive to read 720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software Services (see the companion vendor/developer list), allows both low density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard floppy drives to be used on the Atari. A utility is included to read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on each computer. The RS 232 ports need to be connected together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. (Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25-pin port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the

confusion of the wide variety of serial port jacks on
different computers. Almost all computers connect into
the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An
850 Interface Module, P:R:Connection, Multi I/O, Black
Box (by Computer Software Services) or similar device
that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a
male DB9 to male DB25 modem cable to connect to your
modem. So why not use this cable as your null modem
cable as well?

For higher speed connections, above about 9600 bps on the
8-bit, you need the flow control lines. You also need
a Multi I/O or Black Box, which use the PBI (parallel bus),
then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C
port.
13 1
o o o o o o o o o o o o o
o o o o o o o o o o o o
25 14

(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed
but also pins 4 and 5 as well as 6 and 8. Or better
yet, make a true 25 wire, straight through cable and use
a commercial null modem. A commercial null modem is
just a small device with the correct lines already
crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

Subject: 12.1) What 5.25" floppy disk drives are available?

==> Astra Double-D?
SS/DS SD/DD? standard /LEDs and such

==> Rana 1000
SS SD/ED/DD standard /LEDs and such can format disks on a
stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- Ultra Speed - 70000 bps
Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps

- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- Ultra Speed (QMEG-OS, SpartaDOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 38000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2001
SS SD/ED/DD 19200 bps or 38000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2002
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS
CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel
DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European

==> SWP ATR-8000
Any standard standard except 1.2 meg and unique DS system
(HD) nice Z80 CP/M system in which CP/M drive acccess is parallel only
thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB
= standard SS/ED 130 KB
= standard SS/DD 180 KB
= 'cylindric' DS/DD 360 KB (XF-551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.

Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.
Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: My-DOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF-551 compatible)
Transmission modes:
- normal 19200 bps
- Top Drive 1050 70000 bps
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary;
full-compatibel with the SDX)
- Ultra Speed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the
XF-551.

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

- Amdek
- XF551 upgrades
- Floppy Board

==> Atari XF521
3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

Corvus ? 10 megabytes Fast but still relatively
slow I/O, kludge through
joystick ports for 800.
Rare
Supra/K-P N/A various Some limitations on drive
type and size and total
number of drives in sys.

FTe Multi I/O various 256 byter per sector
restriction. 256K and
1 meg ramdisk models.
Printer and modem, modem
will handle 19.2K bps
CSS Black Box various Will handle all SCSI drives.
Allows 9 drive access for
MYDOS. Currently the only
modem interface with CTS/RTS
hardware flow control. 19.2K
ready.
SWP ATR-8000 unknown limits Rare daughterboard for hard
drives. I/O is probably
fairly slow on this baby and
there may be DOS restrictions.

==> IDE/AT-BUS hard disk (still under construction)

Subject: 12.4) How can I use an IBM-PC as a storage device for my Atari?

Original by Dave Paterson, mailto:d.paterson2@genie.geis.com

SIO2PC is a cable and software combination that lets you use your PC as up to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to 16 megs. SIO2PC also lets you redirect the printer output to your PC printer or to a file on the PC. High speed drives are emulated (a la US Doubler).

All these functions are transparent at the Atari end; you never notice the difference between SIO2PC and regular drives, except that the SIO2PC drives are faster than any others (except Ramdisks and PBI interface drives).

SIO2PC 3.19i is shareware by Nick Kennedy.
Merit/UMich: Sio2pc/sio319i.exe

Of importance to SIO2PC users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g is disk-based; SpartaDOS X 4.21 is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/

developer list); MYDOS 4.53/4 is freeware from Wordmark Systems (Charles Marslett and Bob Puff).
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
Merit/UMich: Os/dos25.arc (DOS 2.5)
Merit/UMich: Fte/fte32g.arc (SpartaDOS 3.2)
Merit/UMich: Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Personal Computer (1979) 8-16K, membrane keyboard, 400/800 OS
800 Personal Computer (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16-64K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
800XE Home Computer (1987?)same as 130XE but 64K. Mostly eastern Europe.
65XE Personal Computer (1985) same as 800XL minus PBI
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
XE Game System (1987) same as 65XE plus Missle Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 Printer -40 col.
822 Thermal Printer -40 col.
825 80-Column Printer -req. 850
830 Acoustic Modem -300 baud req. 850, with Telelink I
835 Direct Connect Modem -300 baud, with Telelink II
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige & black metal versions
1010 Program Recorder -Sanyo and Chelco versions
1020 Color Printer -40 col., print/plot in 4 colors
1025 80-Column Printer -7-pin dot matrix
1027 Letter-Quality Printer-80 col., letter quality
1029 Printer -7-pin dot matrix, same as Commodore MPS-801
1030 Direct Connect Modem -300 baud, with ModemLink
1050 Disk Drive -SS/ED 128K with DOS 3 or DOS 2.5
1064 -64K RAM module for 600XL
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem -300 baud, with XE Term
XMM801 Printer -80 col. Ribbon: Mannesman/Tally MS80
XDM121 Printer -80 col.letter quality. Ribbon: Silver Reed CF130
XF551 Disk Drive -DS/DD 360K with DOS XE
XEP80 Interface Module -80 col. video display and DB25 parallel port

SX212 Modem -1200 baud, rarely with SX-Express! package

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1200 1200XL internally, many slight cosmetic differences
800XLF 800XL incorporating a FREDDY chip (as in the XE's)
1250XLD Earlier concept of the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL Earlier concept of the 1450XLD
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
1090 XL Expansion System-for PBI, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XTM201 -non-impact printer
XTC201 -non-impact color printer

Subject: 13.3) What are the power-supply requirements for my Atari components?

As with the rest of this FAQ list, please let me know if any of this information conflicts with the units you have. I'm also not sure how much of this section is valid outside North America. If it's not valid where you are, I need to hear from you!

The most important information is the voltage (in volts) required, and whether you need a transformer (AC output) or an adapter (DC output). The power (in watts) and current (in amperes) specifications of the original equipment as presented here should be regarded as minimum values. Higher-than-specified power and current capacities are entirely usable, and often preferable because such supplies run cooler and last longer.

Power (in watts) = current (in amps) * voltage (in volts)

9 V AC 5.4 VA (600 mA) Atari#CO62195 transformer:
1030

9 V AC ???? VA (??? A) Atari#CO61516 transformer:
1010

Subject: 13.5) What BBS software can be used on the Atari?

This section by mailto:winston@merk.com (Winston Smith)

Here is the run down of ATARI 6502 8-BIT BBSes that I am aware of:

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was
the first to support a RAMdisk, which Paul Swanson called a "V:" device
for "virtual disk". This BBS was written in Atari BASIC and required a
joystick hardware "dongle" device. This was notable as being one of the
first Atari 8-BIT BBSes that could actually go for a week without having
to be rebooted. Pointers to the message base were kept in an Atari "very
long string" (for which Atari BASIC is famous). The BBS would only have
problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of
the commercial BASIC XE cartridge to run. This BBS program was very
popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SpartaDOS environment. This was a problem
until very recently, when the disk-based version of SpartaDOS was
re-released as shareware. This BBS program uses a "modem clock string"
rather than an R-Time 8 cartridge in order to retrieve the current time.
It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE
cartridge in order to run. It is in the public domain and can import and
export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only,
control ATASCII graphics are reserved for message data-structure bytes).
FOREM-XE BBS is still currently in use as we speak, and may be reached via
the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in
effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM
terminal program of days gone by. I am not familiar with this program. I
think that it is written in Action! and only supports XMODEM Checksum
transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and
comes with a "dial out" screen so that the Sysop can use the BBS as a
terminal program to call and fetch files without having to bring the BBS
down and reload a terminal program. OASIS supports "Door programs" which
it refers to as "OASIS PAL modules". This OASIS demo module comes with an
excellent message system. The OASIS file system is one of the most
complicated that I have ever seen. It consists of "file libraries" with
suites of "file types". There is quite a bit of overhead involved in
performing a download (which may be a good thing, as it discourages file
hogs). There is a commercial version of OASIS called "OASIS IV" that

performs networking. There was an OASIS network between Boston, Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank Walters wrote it.

OASIS IV, CARINA, and BBS-EXPRESS-PROFESSIONAL! are all commercial programs. I haven't heard anything about OASIS IV and CARINA for a while, but PRO!-BBS is still a viable commercial enterprise last that I had heard.

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

1) See the "Atari 8-Bit Computers Vendors and Developers List." The latest version may be obtained in the following locations:

ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/vendev
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/vendev/faq.html
news:comp.sys.atari.8bit news:comp.answers news:news.answers
mailto:mail-server@rtfm.mit.edu, message says:
send usenet/news.answers/atari-8-bit/vendev
quit

You can also ask me for a copy at mailto:mcurrent@carleton.edu

2) "The Official **AC** Vendor List" is maintained by Atari Classics magazine's Advertising Editor, Bob Scholar, mailto:r.scholar@genie.geis.com. This list focuses on North America, but all sources listed have been personally confirmed by the AC staff.

Subject: 14.2) Where is my nearest 8-bit Atari BBS?

The "ATARI CLASSICS Atari Bulletin Board System listing" is maintained by Lawrence Estep, AC's Telecommunications Editor, mailto:71450.1050@compuserve.com.

Subject: 14.3) Where is my nearest 8-bit Atari user group?

An 8-bit Atari user group listing is maintained by Atari Classics magazine's Exchange Editor, James King, mailto:jeking7@delphi.com.

Subject: 14.4) How do I use my new or emulated Atari?

"The Unofficial Atari 8bit Newbie / Stupid Question / Emulator Help FAQ" is maintained by Bill Kendrick, mailto:kendrick@sonoma.edu. You can write to Bill at New Breed Software, 59 Palm Lane, Novato, CA 94945.

Subject: 14.5) What prominent Atarians are reachable by e-mail?

The "Who's Who in the Atari Community E-Mail Directory" listing covers people involved in all of the Atari computing and gaming platforms. This file is maintained by Len Stys, SIG Manager of the Cleveland Free-Net Atari SIG. Write to the Atari SIG at mailto:xx004@cleveland.freenet.edu.

End of atari-8-bit/faq

1849. Re: What can y'all tell me about ACTION! ?

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-01 18:20:07 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <133905@cup.portal.com>
Source record: 93972

Tim; The two worst things about Action! are it's price, ~$50, and it's manual. Figure with some of the other languages like built in basic or C being available for free, you have to have a significant performance increase for as many people who do use it. I went overboard myself & when someone was selling a used cart for $30 I bought it as a back-up just so I'd never be without one. I'm actually learned ML before I learned basic, so it's not like I can't go for the speed of ML *if* I want to. I also have the Atari ED/ASM cart, Mac/65, an a couple of disk based macro assemblers, but I'm one of those guys who can never find his disk of macros so having the near equivalent of ML macros in a cart is the best solution. I'd guess I can do an Action! program in about 1/10th the time it takes me to do the same thing in M/L, maybe 1.5X basic since you lose the immediate mode. You end up with code that on average is about 70% the speed of M/L. The programs HomePak & Express were done in Action! so for modems at least, you're good out to 2400 baud with out problems.
The nag Wagner had about it being a mix of languages is right, but not really a problem. The authors just used descriptive keywords rather then cryptic operators in combination with a streamlined subroutine calling convention to get a language that reads like Basic or Pascal, but runs faster then C. IMO: It has a better interface to M/L then any other language I've used. If you want to imbed code in a routine, you just use brackets [104 104] as an example anywhere in your source code & the compiler just ignores any syntax & figures you know what you're doing. The language is HIGHLY structured. You have to define everything before you use it.

```
PROC Blah0()
;whatever
RETURN
PROC Blah1()
Blah0()
RETURN
```

Works while

```
PROC Blah1()
Blah0)
RETURN
PROC Blah0()
;whatever
RETURN
```

does not. <left out (in the example, that would really make it not work>
The editor is the best & the speed of the compiles is great. I had one demo I did for a friend that was about 90k of source code. Only took 6 minutes to compile from ramdisk. Most of the stuff you can compile right from memory so there isn't any of the C cycle i.e. load editor & write program, exit editor & invoke compiler, load editor & fix code, ...
In addition to the $$$ Action! does take a commitment in time to learn.

Probably a month of every other night of fooling around before you get comfortable. It's a lot easier to learn if you already know C or Pascal. There's stuff available like a PD runtime package, programs to let you compile to disk, increase the number of variables you have in a program. Not all this stuff is documented so the only way to find out how to do something is to ask.
Rick

1850. Re: Atari 400/800 Donkey Kong

Newsgroup: comp.sys.atari.8bit

>
>The Atari Black Box is flat, and shaped like the letter "T" (sort of).

I can't imagine seeing a Black Box at a flea market. After all, what is
the Black Box but an after-market enhancement to a system which was dead
(to the masses) before it really came out? People weren't buying Black
Boxes in 1982...

That implies that the only people who would have *bought* Black Boxes
were probably dedicated 8-bitters, few (if any) of whom would dare to
junk it at a flea market.

This may explain why private parties almost never sell used software and
hardware for the 8-bit which came out after the 8-bit platform lost its
widespread commercial viability. Almost everything you see for sale
(with respect to private party ads for used merchandise) is selling
software and hardware which was purchased by people who were more likely
to junk them once faster/more powerful stuff came along. Hence Bill's
surprise that someone was selling a used Black Box, I'd imagine...

1852. ACTION!, fix 800 and SIO2PC

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-01 20:32:09 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1995Mar01.152607.19021@wariat.UUCP>
Source record: 93975

Comments on three threads. ACTION! is a relatively easy language to
use and compiles to very fast executable code. It doesn't support
floating point, but you could write your own routines access the
floating point in ROM. I enjoy it. It is very easy to put in line
machine code in.
Itay's 800: This probably won't help, because you can't get another
800 to do what I'm talking about. The 800 is fun to do basic, don't
know much figuring out where the problem is because it is modular
in construction. You can swap out the power supply board, mother
board and ROM/RAM board and isolate the problem (if of course, you
have a second 800.) The 'personality' board, RAM, and ROM boards
can even narrow further your search for the problem. Since your
800 comes up eventually, I suspect a power supply board problem.
J. King's trying a null modem with SIO2PC:
I don't know beans about SIO2PC, but I would remind Mr. King
that 850 Express does not allow null modem connections, use
BobTerm.

Keyword was tried. <grin, just kidding> I honestly never used Action!, but I can usually pick up any language with a resource of source code.

Pascal, to me, looks like an extension of BASIC, so I bet it is easier to learn than C, but I feel that C is more flexibile, especially with things like pointers, which come in handy very often.

I wouldn't mind one fairly cheap as well if anybody has the knack of
making these widgets. However, I spoke to Derek Fern, who still supports
the 8-bit extensively, recently and he gave me the number of a chappie
who sells the cables with software for around 25 UKP I think. He is

DAVE UIENS (0191) 271 0086

Again though, if anybody sells these cheaper, I'm a definate buyer!!

Cheers, Ric.

(I love Action! :) I'm glad this thread came up :))

Rick, you said: "I had one
demo I did for a friend that was about 90k of source code. Only took
6 minutes to compile from ramdisk."

>> 90K << of source code!?

How big was the executable!? And what was it!? :) :) :)

Of course, I've probably done 30-40K programs (BBS for example) but ..
6 minutes? Hmm.. wow. And you didn't run out of variable space (I HATE
that! >:^(It should kill decs when it sees a new PROC (except for globals)
(or does it already?))

You also, said:
"programs to let you
compile to disk, increase the number of variables you have in a program."

1) Where can I get the compile-to-disk mod?
2) I didn't notice the increase # of vars. mod when I first read it, but..
as you can tell, I'd like to know where I can get THIS to!? (When
adding RunTime.Act, it adds to the variable list vs. renames built-ins..
(built-ins are one of the few "exceptions" in Action! but it is of course
the most useful; makes it a tad more BASIC-like)
(On a side note, I wish the editor would let one "hide" parts of the code;
ie, if I want "IO.ACT" inside my code (NOT via an INCLUDE which slows it
down), I'd probably not want to have to stare at it :))

"the only way to find out how to do
something is to ask."

I'm asking! I'm asking!

The only mod I've seen for Action! is a TSR-style addition to the editor,
Control+? (Shift+Control+/) displays free mem in the editor (/compile space).

Later!
-bill

1857. Atari 7800 system for sale

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-01 21:48:05 UTC
From: mrathwel@uoguelph.ca
Message-ID: <3j2q2l$4l@ccshst05.cs.uoguelph.ca>
Source record: 94103

Due to space reasons, I'm forced to sell my beloved Atari 7800 system. While I'm willing to let it go to the person who makes me the best offer, please keep a couple of things in mind:

1. I understand the value of depreciation on electronic equipment. However, I did spend more than $1200 on this setup in total (ie. prices, shipping, taxes, phone calls etc) and would be rather offended if someone offered me $75 for the set. Many of the games and items are quite rare.

2. Buyer agrees to pay shipping. I'd prefer UPS because it's insurable and cheaper than POSTAL mail.

3. If you are interested in buying the system and selling the parts to make a profit, please look elsewhere. The disturbing trend of people buying up rare carts and then inflating their prices *REALLY* bugs me. I bought these games for entertainment purposes and would like to sell them to someone who will play them, not sell them.

4. I may be interested in selling things individually, but people who offer to pay for the full set will get priority. It makes things less complicated this way.

5. Please only make bids if you're serious. I have had problems with people making bids and then not following through later. This causes me, and serious bidders consternation.

Thanks! Now ... onto the "collection."

Hardware:
==========

1. Atari 7800 console - hasn't got an expansion port, but does play "Robot Tank." The only 2600 cart I've had trouble with is "Decathalon" which sometimes works and sometimes doesn't. Has original Box and manual.

2. Later model power supply. The one that came with the unit was one of the original flimsy ones which died quickly. It's replacement is a more durable one.

3. Two Proline Controllers.

4. Two Joypad Controllers. These are the little NES-type pads seen in the Atari Advantage posters. They are *VERY* rare and cost me a pretty penny earlier this year (ie. $30 US + shipping & handling).

5. One Epyx 500JX Joystick - shaped to fit in your hand.

6. TV Hook-up supplies.

7. Light Gun.

8. Four modular cartridge library cases. One of them has never been used.

9. All three issues of the "Atarian" video game magazine.

Software (7800 Games)
=====================
All games have instructions, a few still have boxes.

1. "Ace Of Aces"
2. "Alien Brigade" (rare)
3. "Asteroids"
4. "Ball Blazer"
5. "Basketbrawl" (rare)
6. "Commando" (rare)
7. "Crack'ed"
8. "Crossbow"
9. "Dark Chambers"
10. "Double Dragon" (VERY rare)
11. "Fatal Run" (rare)
12. "Fight Night"
13. "Food Fight"
14. "Ikari Warriors" (rare)
15. "Jinks" (rare)
16. "Joust"
17. "Karateka"
18. "Kung Fu Master" (extremely rare)
19. "Mat Mania Challenge" (rare)
20. "Ms. Pac-Man"
21. "Mean 18 Ultimate Golf" (Very rare)
22. "Midnight Mutants" (rare)
23. "Motor Psycho" (rare)
24. "Ninja Golf" (rare)
25. "One On One Basketball"
26. "Pete Rose Baseball" (rare)
27. "Planet Smashers" (rare)
28. "Pole Position II"
29. "Robotron 2084"
30. "Scrapyard Dog" (rare)
31. "Summer Games" (rare)
32. "Super Huey"
33. "Tower Toppler"
34. "Winter Games" (rare)
35. "Xenophobe"
36. "Xevious"

Software (2600 Games)
=====================
1. Adventure
2. California Games
3. Double Dragon
4. Kangaroo

5. Midnight Magic
6. Off The Wall
7. Pac-Man

In addition to these carts, I may have other 2600 and 7800 games
to throw in, if other net deals fall through. If you're interested in
this package, please E_Mail me. Thanks!

: cable also.

The weird thing is, you need an interface hooked up (P:R: or 850) even
though the SIO2PC hooks up through the SIO!
Is there any way to bypass the R: handler, to gain speed?
What I need is info on how to set baud, and to output and input plain
single bytes.. I tried poking around with a memory map, but trial and
error didn't work. I don't have suitable resources for programming the
SIO hardware! Can anyone help? I program assembly.

If you're using DOS 2.0, 2.5 or MyDos, files can not begin with a number.
SpartaDos doesn't mind. There is a hack (a couple of POKEs, I believe) that
does permit you to use numbers - if you went to BASIC, did the pokes,
returned to DOS and renamed the file you'd be OK. I'll look through Mapping
and see if I can find the addresses.

NB: What version of DOS are you using?

Dave

i usually just use dos 2.5 or MYDOS since i dont wanna pay 50
dollars for spartados orwhatever vender prices are going these days. And
since i only have 2 1050 drives and no harddrive, i really just use dos
2.5 more than anyhing.

1862. AtariWriter files

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-02 00:37:45 UTC
From: kssimon@indiana.edu
Message-ID: <kssimon-0103951937450001@3-1.free.i.net>
Source record: 93986

Hi! I have an Atari 800 and 130XE(?) system at home. With the works--
850 interface, Indus disk drives and acoustic(!) 300 baud modem.
I have a lot of old work that I did using AtariWriter.

Is there any way to upload these files as text files, so that I
can download them to my Macintosh? It's been so long since I have
used AtariWriter that I don't remember its capabilities. I can't
imagine it could save a file as plain text. Not to mention ASCII
text.

Does anyone know what an AtariWriter file looks like when it's
uploaded as text? Is it too thick with code to bother?

Thanks for any help...

Ken

1863. About the 1029 printer

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-02 00:52:56 UTC
From: ziggy29@rahul.net
Message-ID: <3j34t8$rin@hustle.rahul.net>
Source record: 93987

I was flipping through the last Best Electronics catalog (or a photocopy of it, anyway) and they show a picture of an Atari 1029 printer. The caption under the printer stated that they weren't sold in the U.S.

Last week, I was at an electronics junk store and I happened to see...an Atari 1029 printer.

Are these things rare? Not that they're particularly collectible, but I am curious. (It didn't have a price, but I'd guess they would sell it for about $5.) Were they European? And how do they differ from the 1025, the other 80-column dot matrix printer of that "era"?

I thought *nothing* about that 1029 until I saw that Best caption. Now I'm curious about how that printer wound up in California...

Atariwriter + had a save ascii function. I don't know about
the original version. Of course, you might just be able to
print the file to the disk drive then transfer the files
to the Mac.

From: James King <jeking7@delphi.com>
Message-ID: <Z69Y9ej.jeking7@delphi.com>
Source record: 93863

Not sure if my last post made it out, but I'm unable to nullmodem
using the SIO2PC cable.

On the PC side, I get a NO CARRIER and OFFLINE status when I try to
xfer files. I'm able to type between the 8bit and PC just fine, but
xfers just wont work.

Any ideas?

Somebody mentioned that the SIO2PC would act as a simple NULLMODEM cable.

From: fbnx@aol.com
Message-ID: <3j3f2b$kst@newsbf02.news.aol.com>
Source record: 93862

I've got pretty much the same setup - a 1200XL with an Atari 830 acoustic modem in one room, and a Mac 512Ke in the other. When I want to exchange text files, I take my phone at the Atari end off the hook and let the line go dead. Next, I load up Bobterm and set the 830 modem to originate mode. I then run to my Mac and load up my terminal software (I like Red Ryder), and connect to my Atari with the ATDT command. Once they acknowledge each other, I use XMODEM to transfer files back and forth. AtariWriter files come over nicely as plain text.

Good luck - I'm sure it'll work.

You can get around the JSR call if you're including an ml block of code
by doing something like

```
Proc GoDos=*()
[$A2 $FF $9A $6C $0A $00]
Return
```

This puts your ml code "inline" and just that one change made my finished
compiled code 35 bytes smaller...

>of Action! code, just ask Bill for his /html/ reader. I think the language

1872. 850 Interface modem and printer cables?

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-02 06:20:57 UTC
From: joneil@infi.net
Message-ID: <3j3ohd$8r2@lucy.infi.net>
Source record: 93996

Does anyone know where I might find a diagram for building
an interface cable for the 850 interface and my modem and printer?
I'm using a Practical Peripherals PM14400FXMT modem and a
HP Deskjet 540 printer. I know I can buy these cables from
several companies but funds are quite tight! And just to verify,
the serial ports on the 850 are not standard and require a special
cable to work with PC style external modems, right?

Thanks!
joneil@infi.net

Makes sense, I thought the problemns would stem from X not using SIO, but
the Sparta Ultra speed I/O makes my system barf and gag almost every time.
I thought patching X for SIO would fix it, but now I see that it won't be
that simple. Too bad.

You technical folks are always over my head here, so perhaps I shouldn't even post this.... But, I saw a "macho" 400 one time that had 64K, a neat keyboard (not the B-key, which had small, misplaced keys), and a 3rd party thing called "Xtravideo" - which routed an ugly black cable out of a notch cut in the side of the case... monitor hookup. I never saw another; these must not have been popular.

How could you be too stingy to get a Centronics printer cable from
American Technavision!? :) They're having an 8-bit liquidation (I gues
trying to fill up with PC stock? :))

Anyway, "#A340 850 or P:R: Connection To Centronics Printer Cable"
$4.95.

Unfortunately, $6 shipping/handling and 8.25% sales tax for CA residents,
but other stuff they have for ultra cheap includes:

games for $2.50, $3, $4, and $5

Bookkeeper Kit WITH CX85 KEYPAD $8.95
Visicalc for $6.95 (w/ manual)
Trakball for $8.95
books for $6.95 (MappingXLXE), $4.00 and $2.50
1050 drive mech for $15!
SIO cables: $1.50 each or TEN FOR $10!
40 pin LSIC chip SETs (CPU/GTIA/ANTIC/PIA/POKEY) for $4.95 or TEN sets
for $37.50!

I'm getting a coupla games (Pac Man, F15 Strike Eagle), Mapping XL/XE
unless anyone thinks it's a waste of $7 (I already have Mapping (original)),
10 SIO cables, 1 set of LSICs, and a Trakball.

That's about $35 + $10 shipping/tax

not too bad.. esp. for >TEN< cables.. that could run $30 regularly anyway! :)

1881. Re: CSS Black Box for sale

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-02 07:30:45 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <ho+71qt.lmcclure@delphi.com>
Source record: 93997

In a message dated 2-28-95, Ralph Barbagallo said:

"What is a Black Box?"

The Black Box for the 8-bit Atari is a device sold by CSS that provides an RS-232 port, parallel port, and SCSI controller, as well as a connector for CSS's floppy board. (The Floppy Board is an add-on that allows for the use of standard 5.25" and 3.5" drives, including high density mechanisms).

"I was at a flea market a few days ago and I saw something called the Black Box. It was really heavy, and seemed to have some RS232 ports or something on the back."

Hmmm...doesn't sound much like a CSS Black Box. As I understand it, it uses edge connectors for the ports, and the power supply is an external power pack, which would make the Box itself rather light. Also, the case is an optional item.

```
Pascal has pointers, right?

Action! has pointers too... hell, this is a fun one:

Proc ABC()
; do stuff
Return

Proc XYZ()
; do stuff
Return

Proc ABCXYZ() ; Action! gurus, can I just do a Card?

Proc Main()
; do stuff
; at one point, either:
ABCXYZ=ABC
; or
ABCXYZ=XYZ
; and then
ABCXYZ()
Return

That way, you can do an IF/THEN to decide WHERE to go only when you NEED
to decide, and then the jump TO the procedure is faster... ie,

If Something Then ABCXYZ=ABC Else ABCXYZ=XYZ Fi
...
ABCXYZ()

rather than

...
If Something Then ABC() Else XYZ() Fi

Which, depending on how often you have to actually JUMP to one of those
procedures, can comparitively REALLY slow down the program!

Also, other cool pointerish things are:

Byte Color0=708,Color1=709,LMar=82,RMar=83
Card ScBase=88

and then replace code like:

Poke(709,lum)

with
```

Color1=lum

which is MUCH faster (no param passing or Jumping)

oh, and of course; normal pointers :)

1883. Hidden analog inputs on XL/XE?

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-02 07:31:58 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <ho-YFum.lmcclure@delphi.com>
Source record: 93998

A question:

When the change was made from the 4 controller ports on the 400/800 to the two on the XL and XE series, the bits that were freed on the 6520 eventually were used for RAM upgrades.

But what happened to the pot (i.e., analog or paddle) inputs on those two ports provided by the POKEY? Do they sit isolated inside the machine, untapped after all these years?

1884. Re: 130xe programming

Newsgroup: comp.sys.atari.8bit

From: kendrick@zippy.sonoma.edu
Message-ID: <3j3sca$9qo@nic-nac.CSU.net>
Source record: 94000

Mike, that "*".. that has eluded me.

Is THAT what shrunk code by 35 bytes? Or just the fact that it's inline.

Another cool Action! trick:

```
PROC VBI()
; do VBI stuff
[ JMPI OldVec ]

...

Proc SetVBV()
; set VBV stuff including assign OldVec to the current VBI vector
Return
```

The "JMPI" is DEFINEd as hex code.

Action! could be better; see some posts I'll make tomorrow if I remember :)

>The GTIA-chip becomes "stupid" and produces GR.15.

There's one thing I don't understand. Does the CPU really get access to
the bus after mode 9 or 8 has been switched on? I though it had to
wait for horizontal blanking. But if that is the case, the CPU cannot
access the control register and switch to a different graphics mode
before the scan line is finished.

Hello !!!

I've heard so much about the relocatable handler table on the XL-machines
but couldn't get any closer information about it !
Is anyone here able to tell me what the function of this table is and how do
I use it ?

Thanks
Matt

1888. 600 XL memory upgrade with two chips

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-02 12:14:43 UTC
From: belitz@genesis.informatik.rwth-aachen.de
Message-ID: <belitz.182.000C3F25@genesis.informatik.rwth-aachen.de>
Source record: 94060

Hello !!!

Here is how to do it !
All you will need are two dynamic RAM 4464 (64*4 bit) and a piece of cable.

First open the computer.
Then pull out the old RAMs U11 and U12 (both 4416).
Now pull out U5, U6 (Multiplexer , LS 158/157) and U18.
Now you have to lift up some pins of these chips so that they won't have any
contact to the socket if they are plugged in again !
Be very careful so that no pin can break ! (If it does it's not the worst
case, all chips are standard ones and you should get them for around a
Dollar).
These are PIN 9 of U 18
PIN 10 of U 6
PIN 3 of U 5
Be careful to choose the right PINs.
Then put the chips back in the sockets, may be you have to cut the PINs a
little bit so that they have no contact to other chips !!!
Then connect

PIN 3 of U 5 with PIN 15 of U 15
PIN 10 of U 6 with PIN 9 of U 15
PIN 9 of U 18 with PIN 7 of U 18

Now you're only have to plug in the RAMs (of course the new 4464 ones).
Then put in power and monitor jack and switch on the computer.
When the "READY"-prompt is shown the upgrade is completed - turn computer
off, put it thogether (keyboard and so on) and run the self test -
48 K of memory are shown .
If the self test is running or the charakters look strange, something with
the multiplexers must be wrong - check if you have choosen the right
pins.
If the computer will not start up - turn off and check all connections.

If have upgraded now two 600 XL this way and have had no errors (except one
choosing the wrong PIN for the multiplexers - but this is causing no damage
and now it runs very good).

I've only shown a very cheap way to upgrade a 600 XL - I'm not guilty if you
will do anything wrong and so be careful !!!

Matt

Nope, SuperAudio (not really that super, actually) is quite different
and less complicated than the Gumby.

SuperAudio(?) consists of one .01uF cap. soldered inline on a resistor --
it provides deeper tones, less background static noise, and a clearer
crisper audio.

I have both a PR:C and ATR8000 connected to the machine that runs the
SIO2PC. The problem appears to be on the PC side - as it doesnt
see carrier detect, so upon trying to xfer files immediately says
NO CARRIER and OFFLINE.

If I could force CD HIGH on the PC side, it would probably work, but
PCPLUS 2.01 doesnt have such an option - and I prefer to use it for
nullmodeming, as I've built LMODEM into it.

>lelie@smail.srl.ford.com
>

I did manage to finish this game once. I made it to the princess several times, but most times she killed me. I never could make it very far using the joystick. I needed to use the keyboard. The Q, A & Z keys perform high, middle and low punches, and the W, S & X keys perform high, middle and low kicks. In thinking about it I may have the kicks and punches reversed. The space bar switches between running and fighting stance the left and right arrow keys move the player left and right. I don't remember which key causes you to bow, but that is important when you get to the princess. I found that my best strategy was to wait for the attackers to move toward me and then kick them as they were moving. Fighting the bird is the hardest part of this game. One other note: after the bird in the building there is a gate made of bars. If this gate closes on you you are dead! The secret is to pass the gate while it is opening, so get it to close without getting killed, stay close and move through it while it is opening.

I took this game as a challenge, but once I won, each game is the same, so I lost intrest in it. I enjoyed this game, but it wouldn't make my top ten list.

I have written a plain O.S. independent serial port driver last week which
outputs or inputs a byte stream of fixed length to the serial port at any
baudrate you want. Currently I'm writing the documentation to which I want
to add _all_ technical aspects and also an example SIO driver which uses
this serial port driver. I hope to release it (as PostcardWare :) within
a few weeks.

I think I'll get some of these too, before it's too late! Especially the
chipset can be very useful! I think it's time to order some catalogs
overseas :-)

> for about $5.) Were they European? And how do they differ from the 1025,
> the other 80-column dot matrix printer of that "era"?

As far as I'm aware they were 'European'. I've got one but really
they are a bit crap and only capable of uni-directional printing
(i.e. they only print in one direction across the paper) and they are
noise as hell. I also think that they only had 7 or 8 pins instead of
9!

For $5, though, they're ideal for printing out program listings and
for making cheap test runs (I'm not going to use my Inkjet to test
alignments and so forth ;-)

1899. 65xe supervideo upgrade

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-02 15:49:51 UTC
From: jeking@xmission.com
Message-ID: <3j4pev$2pp@news.xmission.com>
Source record: 94091

After performing the SuperVideo and SuperAudio hacks on my XL's and 130xe's, I noticed that no such upgrade
was created for the 65xe. The internals of the 65xe are closer to the 130xe, but have several
components unique to the 800xl.

Will the 130xe video hack or the 800xl video hack work on the 65xe? This 65xe has horriblly blurry
video and it would be nice to upgrade it.

Any comments greaty appreciated.

Message-ID: <133997@cup.portal.com>
Source record: 94070

RE: 90k source. The actual code in the program was probably only about 1k, everything else was just 3 Graphics(15) screens converted to Byte Array data. By sliding the target of a brute force move I had a dancing Mickey Mouse moving accross the screen in Energiser Bunny fashion. If I had it to do over I would probably go for a redefined character set/Gr.(12) screen, but it was before I really learned how to do the conversion. With the runtime package & all the graphic data the final program was about 30k. Not exactly an example of good programming, but my friend's children loved it. Rick

James; I have had that no carrier detect problem with some hacked
null modem cables I've made & what worked best was configuring the
clone for an unlisted modem & using old software on the Atari, like
Amodem 4.2 that would let you force terminal mode.
Rick

1902. Re: Hidden analog inputs on XL/XE?

The extra pots are there, you just have to 1st bend the pins out since they
are tied to the +5V supply pins [8,9,10,11] I think. 2nd run one of
the translator programs. The xl/xe changed the OS so they aren't read, the
translator/800/400 I have puts them back on. I'd guess if you wanted to
read Pokey directly, you wouldn't have to use a translator, but it's a
quick & dirty way of getting the pots working. The regular pots have a
1.8k resistor in series with their input so you may want to add that to
be on the safe side.

1903. Atari 1029 printer

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-02 17:46:13 UTC
From: CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK
Message-ID: <1CAB34E1DF5@east-01.novell.leeds.ac.uk>
Source record: 93877

As far as I am aware the 1029 printer was only ever sold in Europe, mainly the UK and Germany. It is a dot matrix model but only has 7pins and as such it is incompatible with virtually every piece of commercial software that requires graphical output. One or two programs have provided support for, these include Mini Office II, Print-LAB, Super Print-Lab XE and most of the later word processors had a driver for it.
The print quality is poor and it is slow and noisy, but it had the advantage of plugging straight into the SIO chain and thus it was popular in the UK, it was also quite cheap #130 ish when other printers were at least #150!

Derek Fern in the UK now has a range of colour ribbons for the 1029, so it might breath new life into it yet!

As to how one got into the US, your guess is as good as mine!

: Byte Color0=708,Color1=709,LMar=82,RMar=83
: Card ScBase=88

Yikes! Looks like a hybrid. I can't tell what's a pointer and what's a variable (no need to get into pointer to this, or that crap, because in C everything is pointers).

: Color1=lum

Let's say you wanted Color1 to be a simple variable? How would you do that? I guess it would have to be something like INT, ?? BYTE in C is a CHAR, in most cases, but it is unstandard. Oh well. Either way I still like C more than Action! or Pascal, but I suppose that is because I use C. I can't really stand Pascal, but that is a personal preference.

1910. Can we start a demo list?

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-02 21:47:19 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.950302132912.25671B-100000@PEAK.ORG>
Source record: 94077

I like to collect the 8-bit demos, and it seems that I have several nice ones (Can't look now, since the 8-bit is away at Puff's). However, I always wonder what I'm missing.

Wouldn't it be great to assemble a list of all the best 8-bit demos there are? Like I've said before, friends who uses PCs with VGA sometimes play with my 800XL system, and are impressed with the graphics capbilities some of these demos display. I'd like to make sure I have all that are available. I will check the Umich archive, but it would be great if everybody could suggest what they believe to be the best demos.

Also, there may be some newbies who are unaware of the presence of the demos. As we've seen recently, there are some people acquiring 8-bit Ataris for the first time (as a 2nd, 3rd...etc computer) who would probably be impressed with the demos.

I can recall some of the old standbys that nobody should be without.

1) "Boink" - 8-bit version of Amiga bouncing ball demo (by Xanth?)
2) "Fujiboink"- the spinning, bouncing Atari fuji with 256-color scroll one side. (a favorite!)
3) Swandemo- the one included with the Xformer emulator. Little white swan flies over a spinning Atari fuji with 256-color scroll.
4) Hyperboink- Like 8-bit boink, but speed can be adjusted faster or slower. Can go VERY fast!
5) CESDEMO- I've seen it called "Robodemo." Screens alternate between a walking robot (coming towards you) and a spaceship flying through space. Very nice! From 1985 CES?????

Are those the extent of the high-quality domestic demos?

There are many FINE European demos by Germans, Polish, Hungarians. They're harder to find, and most notably, many exist without everyone's knowledge of them. WHAT'S YOUR FAVORITE???

There's one called "Cool Emotion" that's Hungarian, and suppsosed to be out-of-site. I've never seen it, though. Anybody know of it?

James

MyDOS does NOT use a filenumber - just the "forward pointer" (= next sector#)
- therefore it can use 16 bits for the "next sector"-number. The last 8 bits
are used to tell you how many of the available bytes are used.

Sorry, can't help you on the boot sector info. But if you find out something,
please tell us.

Howdy Bill

PabQWK is the easiest (make that: least difficult) way for me to read UseNet
and get Email.
PabQWK is fastest when run under SpartaDOS.
(as I probably said earlier, I LOVE MyDOS and I HATE Sparta. (Don't know if
your history teachers ever told you about the time when the Greeks ruled
Europe? Well, there was a place/province called Sparta at that time, where
every man was trained to be a very tough soldier. Time repeats itself.)

About the girl, don't know if I told this here before, but I know this tall,
beautiful, intelligent, blond girl for whom I'd drop not only MyDOS, but even
my 8 bit. (and they're the only ones I've got)

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <134005@cup.portal.com>
Source record: 94089

Bill; I was checking through some of my old Action! disks, not sure I'll
be able to find everything you need but...
The programs you really need are RTSCAN & the one that doubles the amount
of symbol table space. If you use the PD RT pack, it pretty much takes
up most of the slots, but the symbol table thing makes it easy to avoid
having to even edit the RT pack. The RTSCAN program is just used when you're
ready for your final compile, up until then you should just be using the
cart routines anyway. RTSCAN produces a list of every PROC that is called
in the program. What I do is have the list in one edit window, the RT pack in
another. I then use the cut & paste function to jump from one window to the
next with the routines I need. If I recall correctly, you should always
have CPY_PARMS or something like that no matter what the docs say. The
compile to disk thing is cute, but IMO: Not really documentated & I've
never had a program that used up all the available memory+ needed the
cart space. I'll try to find/uue the stuff, but I probably won't get
to it this week.
Rick

Looking at my SIO2PC cable, it has no connection to the DSR or DCD pins, if
you leave these open, then they read as offline and no carrier.

It probably will work, you just need to get the comms program to accept
data without the modem controls being in the 'correct' state. If there
is a hardware handshake option in the term. program, try turning it off.

MyDOS does NOT use a filenumber - just the "forward pointer" (= next sector#)
- therefore it can use 16 bits for the "next sector"-number. The last 8 bits
are used to tell you how many of the available bytes are used.

Sorry, can't help you on the boot sector info. But if you find out something,
please tell us.

Howdy Clay

Yes, please do. I've been looking for such a file for years. I've even tried
to put together some code myself, but I guess I have to sit down and read one
of the articles in one of the old magazine's (read: I really don't get it!)

Sorry I didn't Email this back to ye', but to make sure you get this, I have
to do it this way. (PabQWK only allows addresses one character shorter
than yours :-) and my internet provider (read his hard/software) still confuses
me. I'm not sure all my Email gets out.)

Howdy Bill

PabQWK is the easiest (make that: least difficult) way for me to read UseNet
and get Email.
PabQWK is fastest when run under SpartaDOS.
(as I probably said earlier, I LOVE MyDOS and I HATE Sparta. (Don't know if
your history teachers ever told you about the time when the Greeks ruled
Europe? Well, there was a place/province called Sparta at that time, where
every man was trained to be a very tough soldier. Time repeats itself.)

About the girl, don't know if I told this here before, but I know this tall,
beautiful, intelligent, blond girl for whom I'd drop not only MyDOS, but even
my 8 bit. (and they're the only ones I've got)

1926. My 400's keyboard is possessed!

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-03 00:34:35 UTC
From: ziggy29@rahul.net
Message-ID: <3j5o6r$7n1@hustle.rahul.net>
Source record: 93888

I bought a 400 yesterday (well, okay, I bought a PS, peripheral cables and paddle controllers for $5 and the 400 and 410 just happened to come with it). It plays cartridge games just fine. Out of curiosity, I popped in a BASIC cartridge and noticed something funny:

The keyboard works fine until I hit RETURN. Then everything gets scrambled. For example, I could enter

10 XYZ

and the display would read (something like)

/$$5$ - 0E#

Which is just "ERROR - XYZ" in garbled code.

Something about hitting RETURN seems to affect something (GTIA, perhaps?)

If I type "ERROR - XYZ" after I've already hit return, I get precisely what I've listed above--"/$$5$ - 0E#".

Anyone seen anything like this before?

I doubt that a 400 is worth fixing unless the problem is in a $2 part and I can fix it myself...any ideas out there?

I've seen 1029s in Canada. They seem to be an improvement on the 1025, since
the 1029 does support bit mapped graphics. Never actually used one myself,
though I do have a 1025.

SuperAudio is a Ben Poehland hack to improve the standard audio output. He
came up with it the old fashioned way - poke around insed the computer until is
sounds better. All it is is the addition of a single cap.

Gumby grafts a second pokey into your machine giving stereo sound. I think
that the gumby design includes addtional caps to improve the output, but it
has been a while since I looked at the plans.

I'm having a little difficulty figuring out the format of the non-data bytes of a MYDOS disk sector. I thought that MYDOS would need a 16 bit "forward pointer" to access all 64K possible sectors; breaking the 10 bit 1023 sector Atari DOS limit. But as far as I can tell, MYDOS uses the upper 6 bits of the first non-data byte as a file number the same as Atari DOS. What gives? How does MYDOS keep track of which sectors belong to which file (and their sequence) on differently sized disks? And does it always use a file#?

If you're talking about VBLITZ (which shows a checkerboard landscape of water-droplet-waving water squares and 5.25" disk squares), that's just all play-back animated anyway, but still pretty cool.

I've never gotten it to run properly but once extracted the picture-data and made a simple RAM-disk-based TurboBASIC XL viewer for it.

I tried loading it on my Newell-256K-upgraded 800XL I just got but it didn't work! It didn't work with a RAMbo 256K 1200XL either. I guess even the Newell isn't 100% XE (ANTIC paging) compatible either, eh? Or is there a "switch" or mode or something I can set somewhere? ANYWHERE!?!?! :)

Ever seen any of the >VECTOR DEMOS<!? Or the Bitter Reality Rzog Plazma demo? NiCE

Cool Emotions' authors (Hard Soft) are planning another demo some time too..

I wish there were MORE cool-coders from Europe with 'net access.. I heard Hard might even lose theirs! :(:(:(

The ATV flyer says:

"Everything must go! Massive Inventory Available"

under the large: "ATARI 8-BIT LIQUIDATION SALE"

Below that, it says:

"Liquidation Prices Effective 03/01/95"

"Greetings Atari enthusiasts and dealers! Established in 1973, American Techna-Vision has been proud to present you with the Worlds largest 8-bit inventory for many years. Enclosed in this flyer, you will find not only the lowest prices you have ever encountered on these products, but also several new products that indicate the changing computer market. We currently have tens of thousands of Atari 8-bit items in stock. We have a good stock on every item listed in this flyer. However times are changing, and we must make room in our warehouse for the ever expanding market. [Read: IBM :)] Warehouse space is at a premium, and we cannot guarantee pricing or availability after 05/31/95. WE ARE NOT GOING OUT OF BUSINESS. We hope to be able to support the 8-bit market [cool] after this date and for as long as possible with your help. All 8-bit items are new and all products are fully guaranteed. All software titles are commercial products."

There ya have it. What I got in the mail

Excuse any trash around "the 8-bit market [cool] after this date";
the modem went FACHZZZZ

seperate commands, C uses the semicolon, BASIC uses the colon, and I have
no clue what Pascal uses. But I am willing to bet that Action! isn't
smart enough to know where commands end, go ahead and try to do something
like a FOR-NEXT loop without ever pressing an EOL and put an IF THEN
all on the same line. It will probably complain of a syntax error.

This is just a guess, but I am sure of it. C uses the semicolon to
seperate commands, so you can do something like this all on one line:

```
for(p=buf;*p!=0;p++); p--;
```

Which would have p pointing to buf, find the NULL (assuming it's an array
of char's) and point to the last char in that array of chars, so it would
be pointing to the 'd' in the above line (in the word would). I guess it
was designed purely for that reason, you actually don't need ANY EOL chars
in C, you could code like that if it makes you happy, but the code looks
pretty disgusting. But I don't really know of any programming language
that can for FACT distinguish between a command or a syntax error, most
languages would produce a syntax error. Even an assembler would.

Just remember, I am not trying to rag on Action!, I was never intending
that, but we were trying to establish something along the lines of what
is the easier to use, and I was trying to make the point that it is more
of what you already know. Like C is easier for me to use than assembler
or Pascal, mostly because I have used C and have never really used Action!
or Pascal. But I would be interested in Action!, since there really isn't
that good of a port of C on the Atari. One comes close, but is still
lacking. I heard C/65 was good, but never checked it out.

```
Oh! Watch what you say before you talk, man! :)

In Action!, the following is FINE; it cares NOT and compiles perfectly:

proc a() byte b for b=1 to 10 do printbe(b) od return

this is identical to:

proc a()
byte b

for b=1 to 10 do
printbe(b)
od
return

and:

proc a()

byte b

for b=1 to 10 do printbe(b) od

return

Also, you CAN declare constants when declaring a variable:

byte a=[10]

printbe(a)

would result in 10

NOT the value stored in memory location 10
and NOT some arbitraty value which happened to be in the memory location
which Action! gave "a" when you ran the program

I actually never use value assignment when declaring; I usually do the
set just before the code which is about to use it; for example, in my
"Simple CPU" runtime (I made an assembler for a simple 10-register + 2 stack
based architecture) I do this just before I actually start executing:

for a=0 to 9 do
register(a)=0
od
pc=0
stacksize=0
pcstacksize=0
```

Of course, I write my code in more readable case: :)

```
For A=0 To 9 Do
Register(A)=0
Od
```

etc

I have just written a little utility to edit Atari Dos 2.x and Mydos 4.5 virtual disks. (for the Macintosh) I've run into a little problem however...

My original assumption was that Mydos uses the last 3 bytes of a sector exactly as Atari Dos, except that the 6 bit file # becomes the highest six bits of the "forward pointer". However, experimentation revealed that Mydos kept using file numbers, even with virtual disks of more than 720 or even 1024/1040 sectors. (I first thought maybe Mydos only would do this with 720 sector disks) Except for the file#, the link# appears exactly as it should. WHY is this happening? How could Mydos use a greater than 1024 sector disk with the file#'s still used?

BTW: I'm using Mydos 4.50 and PCXFormer 2.5 for this.

You running a PRO board with Ledbetter's last upgrade?

MAN!!!! Your missing ALOT!! PRO has changed drastically since Letbetter sold the rights to Steve Carden.

PRO is now a MUCH more powerful system than it used to be. It's also much faster, and it has grown in size as far as how many files come in the package.

I'm not sure, but you may (if interested) be able to get an upgrade from Steve for $25.00 (although I'm not sure) because your already an owner. I'm up to PRO version 4.0b, and 5.0 may be on the market (not sure about that -- been offline too long).

If you ever have some time during the day on weekends, call my bbs 612-221-9895, and I'll show you some things you may not have seen for PRO.

>party thing called "Xtravideo" - which routed an ugly black cable out of
>a notch cut in the side of the case... monitor hookup. I never saw
>another; these must not have been popular.

I know the feeling. I'm actually a budding technical wannabe with respect to hardware hacks. With a somewhat broken 400 in my possession now, I have a "laboratory" to work with, so to speak. It's hardly a heartbreak if I hack the 400 to its total death. (It works well as a cartridge game player, but that's it.) I'm hoping I can fix that thing--not because I really care to have a working 400 (16K and membrane keyboard? Yuck), but because that could give me the experience/confidence necessary to perform hacks and upgrades on my 800 and 800XL successfully.

Now that I've pieced together a system (and then some--I have a 1050 with two more on the way and *four* 1010s), I have only a few needs remaining, and I'd appreciate comments on how I should proceed. The various FAQs have told me a fair amount about this stuff. In many cases, there are several options available in the upgrade FAQ. Here are my more immediate needs/wishes:

* Modem. I'd like at least a 2400 baud modem hooked up; 9600 or 14.4 would obviously be preferable. Would a 9600/14.4 modem require additional equipment/hacks than 2400? If so, 2400 will suffice for now (it's not like I'm Web surfing on the Atari, and files for the 8-bit tend to be much smaller. I still have 14.4 on the Windows box).
What equipment will I need? An 850? A P:R: connection? Those tend to be ~$50 from what I've seen. Is there any cheaper way to connect a

> 1200 baud modem to the 8-bit?

* Hard disk drive. I have an unused 60 MB partition on a hard drive in an Intel box. I believe SIO2PC would allow me to use this, but it would require that I keep our second Intel box (I'd rather sell it and buy more cool 8-bit stuff :)). Is there anything which would let me connect a small external hard drive (IDE/MFM/RLL/et cetera) to the Atari as a dedicated hard disk drive? [Before I can sell the second Windows box, I *must* have a modem with comm software up and running on the Atari--my wife and I are frequently online at the same time and I really would like to save our marriage.]

* Monitor. The RF output to the TV sucks. Come to think of it, the TV sucks. Rather than buy another TV, I'd like to get the video output to a color monitor--but sound must be supported *somewhere*, and with quality at least equal to that coming out of the TV. Ideas here would be welcome. Oh, and I'd really like to get 80 column output--at least for communi-cations and perhaps word processing.

Once I get this stuff, it's sayonara to our second Intel box. Take that, Bill Gates. (phhhbt)

1952. De Re Atari, A Dilema

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-03 21:12:15 UTC
From: nerini@primenet.com
Message-ID: <nerini.11.000D2EE2@primenet.com>
Source record: 93866

Hey folks, I've got a little moral dilema here, and would like some general opinions, before I make up my mind on what to do.

To preface, I love my Atari, but I _DO_ consider it more of a collectors item than a living system. and As such, I'll buy all the software I can, but won't limit my collection of rare material/software to purchases.

But, here's my dilema. Quite by accident recently, I discovered my City library had a copy of De Re Atari. In storage of course. When I went down there to check it out, the lady said, "Ok, come back in 5 minutes and I'll have it for you." 20 minutes later she returns with the book, and says "Sorry about the wait, I had trouble finding it. It 'fell' into a bin marked 'recycle'." Well, I have the book now, and considering the rareness of it, should I keep the book and pay them, or is this just screwing over other Atari fans too much?

1953. Action! commands

Newsgroup: comp.sys.atari.8bit

Very quickly, the Action! built-in functions/procedures in the library include:

```
Print / PrintE - string
PrintB / PrintBE - byte
PrintC / PrintCE - card (unsigned word) the "E" means "with end-of-line"
PrintI / PrintIE - int (signed word)
PrintD / PrintDE
PrintBD / PrintBDE the same as above except to specific I/O device channels
PrintCD / PrintCDE
PrintID / PrintIDE
PrintF - formatted
Put / PutE - put byte
PutD / PutDE - put byte to device
InputB / InputBD - read byte string
InputC / InputCD - read card string
InputI / InputID - read int string
InputS / InoutSD - read character string
Open / Close
Note / Point
XIO
Graphics
SetColor
color - this is a system variable, actually
Plot / DrawTo
Fill
Locate
Sound / SndRst
Paddle / PTrig
Stick / STrig
SCompare
SCopy / SCopyS
SAssign
StrB / StrC / StrI
ValB / ValC / ValI
Rand
Break
Error - system variable
Peek / PeekC
Poke / PokeC
SetBlock / Zero / MoveBlock
Device - system variable
Trace - system variable
List - system variable
EOF
```

There ya go!
Later!

1957. 1050 Drive problemn

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-04 04:49:47 UTC
From: bjcorr@delphi.com
Message-ID: <9503032327591.DLITE.bjcorr@delphi.com>
Source record: 93869

Okay guys, got a problemn. I picked up a 1050 drive at a used computer store today (finally, no more single density!), took her home and fired her up. Lights come on, disk spins and settles. Booting gets me a screenful of garbage. Okay, I boot from the 810, get a directory from the 1050, I get a 144. I clean the heads. Same results. So I delve deeper into the heart of the beast and find the 4 pin connector at J10 is backwards! (I'm fairly sure of this comparing it to J11.J12 and J14.) So I turn it around. Now lights go on, but NO disk spin, ever. Head jumps around (as before) but no spin.
So I assume something is fried, probably due to the reversed plug, but what? Is this perhaps fixable by me or do I have to send it in? Any educated guess's out there?
And yes, when I turned the plug around to the original (reversed) position the disk spins as before.
The drive is a Tandon unit and appears unmodified, has the version K ROM.

Any help/advice appreciated!

I just aquired a CX85 numeric keypad. I'd love to add support for this little beauty to FlickerTerm, but don't seem to have any information on how to do so.

How the heck do you read this thing? Scanning the joystick port almost works, but some of the keys generate the same values.

>You running a PRO board with Ledbetter's last upgrade?
>
>MAN!!!! Your missing ALOT!! PRO has changed drastically since Letbetter sold
>the rights to Steve Carden.

Hey! I still run that from time to time... though I did just put in an order
for BBS Pro multiline this afternoon...

>I'm not sure, but you may (if interested) be able to get an upgrade from Steve
>for $25.00 (although I'm not sure) because your already an owner. I'm up to
>PRO version 4.0b, and 5.0 may be on the market (not sure about that -- been
>offline too long).

An update disk from version 3.2c of the core can be had for $25...other
than that it will cost $39.95 to move up to Pro.

>The GTIA-chip becomes "stupid" and produces GR.15.

Konrad,

I'm curious about how you discovered this technique?

Back in '87 or '88, I wrote a character generator with the intention of being able to include Gr.9 pics into a screen of Gr.8 based text. I was surprised to find that I could not switch back to Gr.8 once GTIA had been switched on. Thus, I had to force all graphics to be aligned with the right edge of the screen, but did get the benefit of being able to put in Gr.15 pics as well as the Gr.9 ones!

I remember thinking that no one else would probably ever discover this strange quirk of the machine. Hat's off to you!

: the beast and find the 4 pin connector at J10 is backwards! (I'm fairly
: sure of this comparing it to J11.J12 and J14.) So I turn it around. Now

There was always one connector that is backwards, and it is probably J10,
when I cracked mine open I thought the same thing, but it works fine
backwards, it must have been a design error. So I would flip that back
around. Just for the record, 144 is Device Done Error (Bad Sector/Disk
is Write Protected), which I found on my unit that the write protect sensor
went bad. But you said you get this error while trying to read from the
disk. It is possible that the disk is bad, or possibly the read/write head
is intepreting it as garbage (broken), or who knows. Have you tried
formatting a disk with this unit?

With mine I was always able to read, just could never write, and when
I bought another Atari and got back into it then I fixed it.

You might want to just get an entirely new mech, since that is usually
the problem, and takes the least amount of knowledge to fix. But I heard
that is about $25 from ATV.

Near as I can tell, Vblitz flips between the pages for Antic while leaving the CPU tied in to the main bank. Most upgrades tie the Antic page to the CPU page which may work for most programs (including the wedge) but won't work if the program tries to run a program at the same address as the screen in the bank select area.

>Atari--my wife and I are frequently online at the same time and I really
>would like to save our marriage.]
For a hard disk, there are a few options:
The MIO II from FTe (release date: 1 April) will support IDE drives.
The original MIO, KP interface and Black Box all support MFM drives (I think).

Hope this helps a bit,

Dave

Source record: 93876

1. "simply genial" in my English means "quite phenomenal" in normal English.

2. I take the full responsibility for your troubles with SHAKE.ARC. You lost about 1/2 hour of your morning, I lost about 2 hours trying to convert the SHAKE demo into a DCM-file. I am not too nervous, but finally I realised that my DiskComm3 (downloaded from MERIT, of course) didn't work (You can depack a DCM file, but you can't convert a disk into a file) with my computer. So I used the SCOPY including it in the archive. I didn't realise that there were Atarians, who didn't have SpartaDOS now, at the end of 20-th century. Sorry for your troubles, Bill.

BTW: I don't know, why the SHAKE demo don't work with your computer. Yesterday I extracted it from *.VOL file back to the disk, and it booted up properly.

In addition to the post in response about tieing CD high with a
switch, you could also use the standard loopback control
connection of tieing pins 6+8+20 together (DTR from 20 feeds back
to DSR and CD on 6 and 8) Continue with tieing lines 4 and 5
together (feeds back RTS to CTS), and you've fooled any terminal
software into blind sending data.

Keep the book and pay your libraries cover charge plus handling fee
(probably less than $20.00 total)

Considering it took 20minutes to find the book, it's doubtful anybody
else has ever requested it - or ever will.

I had this dilemma once and kept and PAID FOR the book from a local
library. Dont regret the decision, as they were going to throw it out..

All this talk about Carrier Detect (CD) and SIO2PC makes me wonder..

has anyone tried sucking files out of a CD-ROM with SIO2PC?

I see NO reason this shouldn't work other than the obvious: it's on a DOS box

What type of good CD ROMs are out there (as if I'll have a CD ROM drive
for my computer) which "we" could use?

I KNOW there a GIF collections; I mean, we ALL know that! >:^)
Are there WAV/MOD collections?
Any way to extract text (or more) data out of Encyclopedia disks!? :)
Of course, that would require a different SIO2PC (either one made for
a specific CD ROM (not likely) or a version which converts a DOS dir.
into an Atari DOS dir and is smart enough to know how to fetch files
when asked to w/o needing to "install" them; hey, why not 1-sector
length files in the VTOC and then SIO2PC does that "I'll go 'round and
'round" trick like it normally does with [I]nstalled files?)

Anyway.. curious.. any luck w/ this, folks?

1978. Atari 8bit Logo - list of keywords

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-04 23:22:55 UTC
From: joepower@ix.netcom.com
Message-ID: <3jasof$46s@ixnews2.ix.netcom.com>
Source record: 93900
Cross-posted to: comp.sys.atari.8bit,comp.lang.logo

I happened to have an old copy of an Atari Logo reference booklet. Enclosed is the bulk of it. There is a 1983 copyright notice from Logo Computer Systems Inc., 9960 Cote de Liesse, Lachine Quebec, Canada H8T 1A1

I hope this helps.

ATARI Logo Primitives (for Atari 8-bit systems)

Note: A number sign (#) indicates a procedure which can take any number of inputs. If you give it other than the number indicated, you must enclose the entire expression in parenthesis. An asterisk (*) indicates an editing command which works both inside and outside the editor. The procedures which output TRUE if some condition is met output FALSE otherwise.

Turtle Graphics

ASK turtlenumber list asks the turtlenumber(s) to run the instructions in list

BACK, BK distance moves the turtle distance steps back

BG outputs the number representing the background color

CLEAN erases graphics screen w/o affecting turtle's state

COLOR outputs the number representing the current turtle's color

CS erases graphics screen and moves the turtle to [0 0] with a heading of 0

EACH list makes each turtle seperately run the commands in list

EDSH shapenumber starts the Atari Logo editor, displaying the shape of shapenumber requested

FORWARD, FD distance moves the turtle distance steps forward

GETSH shapenumber returns a list of 16 numbers; these numbers correspond to the bits in the shape

HEADING outputs the current turtle's heading

HOME moves the current turtle(s) to [0 0] and sets heading to 0

HT makes the current turtle(s) invisible

LEFT, LT turns turtle degrees left (counter-clockwise)

PC pennumber outputs number representing pen color of pennumber

PE puts pen eraser down

PEN outputs pen state (PD, PU, PE, or PX)

PENDOWN, PD puts turtle's pen down

PENUP, PU raises turtle's pen

PN outputs the pen number (0..2) currently in use

POS outputs coordinates of turtle's position

PUTSH shapenumber shapespec gives shapenumber the form of shapespec

PX puts reversing pen down

RIGHT, RT degrees turns turtle degrees right (clockwise)

SETBG colornumber sets background to colornumber (0..127)

SETC colornumber sets current turtle(s) to colornumber

SETH degrees sets current turtle's heading to degrees

SETPC pennumber colornumber sets pennumber (0..2) to colornumber (0..127)

SETPN pennumber sets the pen to pennumber (0..2)

SETPOS position moves the turtle to position

SETSH shapenumber sets the shape of the current turtle to shapenumber

SETSP speed sets current turtle's speed (-199..199)

SETX x moves the turtle horizontally to x-coordinate x

SETY y moves the turtle vertically to y-coordinate y

SHAPE outputs the number representing the shape of the
current turtle

SHOWNP outputs TRUE if turtle is shown

SPEED outputs speed of current turtle

ST makes the turtle(s) visible

TELL turtlenumber(s) addresses all following commands to turtlenumber(s)

WHO outputs number of current turtle

WINDOW makes graphics screen a window of an expanded turtle
field. The screen is cleared.

WRAP makes turtle field wrap around edges of screen. The
screen is cleared.

XCOR outputs turtle's x-coordinate

YCOR outputs turtle's y-coordinate

Words & Lists

ASCII character outputs ASCII code for character

BUTFIRST, BF obj outputs all but first element of obj

BUTLAST, BL obj outputs all but last element of obj

CHAR n outputs character whose ASCII code is n

COUNT obj outputs the number of elements in obj

EMPTYP obj outputs TRUE if obj is empty

EQUALP obj1 obj2 outputs TRUE if inputs are equal

FIRST obj outputs first element of obj

FPUT obj list outputs list formed by putting obj on front of list

LAST obj outputs last element of obj

LIST obj1 obj2 outputs a list of its inputs

LISTP obj outputs TRUE if obj is a list

LPUT obj list outputs list formed by putting obj on end of list

MEMBERP obj list outputs TRUE if obj is an element in list

NUMBERP obj outputs TRUE if obj is a number

SE obj1 obj2 outputs list of its inputs (if words) or the members
of its inputs (if lists)

WORD word1 word2 outputs word made up of inputs

WORDP obj outputs TRUE if obj is a word

obj1 = obj2 outputs TRUE if obj1 equals obj2

Variables

MAKE name obj makes name refer to obj

NAMEP name outputs TRUE if name has a value

THING name outputs object referred to by name

```
------------------------------------------------------------------------------
Arithmetic Operations
------------------------------------------------------------------------------

COS n outputs cosine of n degrees

INT n outputs integer portion of n

# PRODUCT a b outputs product of its inputs

RANDOM n outputs a random integer between 0 and n - 1

REMAINDER a b outputs remainder of a divided by b

RERANDOM makes RANDOM behave reproducibly

ROUND n outputs n rounded off to the nearest integer

SIN n outputs sine of n degrees

SQRT n outputs the square root of n

SUM a b outputs the sum of its inputs

a + b outputs a plus b

a - b outputs a minus b

a * b outputs a times b

a / b outputs a divided by b

a < b outputs TRUE if a is less than b

a > b outputs TRUE if a is greater than b

a = b outputs TRUE if a equals b

------------------------------------------------------------------------------
Defining & Editing Procedures
------------------------------------------------------------------------------

EDIT, ED name(s) starts Logo editor with named procedure(s)

EDNS starts Logo editor with all variables in the workspace

END ends the procedure definition started by TO

TO name (inputs) begins defining procedure name

------------------------------------------------------------------------------
Flow of Control & Conditionals
------------------------------------------------------------------------------

COND condnumber outputs TRUE if the particular condition specified by
condnumber is occurring

IF pred list1 (list2) if pred is TRUE, run list1 otherwise run list2 if it
exists
```

OUTPUT, OP obj returns control to caller, with obj as output

OVER turtlenumber pennumber Outputs number symbolizing collision between turtlenumber and pennumber

REPEAT n list runs list n times

RUN list runs list; outputs what list outputs

STOP stops procedure and returns control to caller

TOUCHING turtlenumber1 turtlenumber2 outputs number symbolizing collision between turtlenumber1 and turtlenumber2

WAIT n pauses for n 60ths of a second

WHEN condnumber list sets up a when demon so whenever condition condnumber occurs, list is run

WHEN condenumber [] clears (stops) WHEN demon for condnumber

Logical Operations

AND pred1 pred2 outputs TRUE if all inputs are TRUE

FALSE outputs the word FALSE. Special input for AND, IF, NOT and OR

NOT pred outputs TRUE if pred is FALSE

OR pred1 pred2 outputs TRUE if any inputs are TRUE

TRUE outputs the word TRUE. Special input for AND, IF, NOT and OR

The Outside World

CT clears text section of the screen

FS devotes entire screen to graphics

JOY joysticknumber outputs the current position of joysticknumber

JOYB joysticknumber outputs TRUE if button on joysticknumber is pressed

KEYP outputs TRUE if a key has been typed but not yet read

PADDLE paddlenumber outputs rotation on dial of paddlenumber

PADDLEB paddlenumber outputs TRUE if button on paddlenumber is pressed

PRINT, PR obj prints obj followed by carriage return (strips off outer brackets of lists)

RC outputs character read by the current device (default
is keyboard). Waits if necessary.

RL outputs line read by the current device (default is
keyboard). Waits if necessary.

SETCURSOR position puts cursor at position

SETENV voice duration sets envelope of voice for TOOT so volume reduces by
one unit every duration

SHOW obj prints obj followed by carriage return (doesn't strip
off outer brackets)

SS (Ctrl S) splits screen: top for graphics, bottom for text

TOOT voice freq volume duration produces sound on voice of frequency
freq and volume for a given duration

TS (Ctrl T) devotes entire screen to text

TYPE obj prints obj leaving cursor at end of line

Workspace Management

ERALL erases everything from workspace. Frees up all nodes.

ERASE, ER name(s) erases named procedure(s)

ERNS name(s) erases named variable(s)

ERPS erases all procedures

NODES outputs the number of free nodes

PO name(s) prints definition of named procedure(s)

POALL prints definitions of all procedures and values of all
names

POD condnumber prints WHEN demon condnumber currently in action

PODS prints out all active WHEN demons

PONS prints names and values of all variables

POPS prints definitions of all procedures

POTS prints title lines of all procedures

RECYCLE performs a garbage collection

Files

CATALOG device: displays names of all files on diskette. On a
cassette, prints all the procedure definitions and
names in the file.

ERF device:filename erases filename from device

LOAD device:filename loads file called filename from the device into the
computer

SAVE device:filename saves workspace onto the device. If the device is a
printer, all procedures are printed.

SETREAD device:filename causes RC and RL to get input from filename on device

SETREAD [] closes the file and redirects RC and RL back to
keyboard

SETWRITE device:filename starts the process of sending to filename on
the device a copy of all the characters
displayed on the screen

SETWRITE [] closes the file

Special Primitives

CALL n transfers control to a machine language subroutine
starting at address n (decimal)

DEPOSIT n byte writes byte to address n (decimal)

EXAMINE n outputs the contents of address n (decimal)

PRIMITIVES prints the list of Logo primitives

SETSCR n sets aspect ratio to n

Special Keys

ATARI key / Reverse Video key after this key is pressed, all characters
typed appear in reverse video on the screen

* BREAK aborts whatever Logo is doing. If editing, changes
made in the edit buffer will be ignored. Clears the
line being typed at the toplevel.

* Ctrl -> moves cursor right

* Ctrl <- moves cursor left

* Ctrl {up arrow} moves cursor up

* Ctrl {down arrow} moves cursor down

* Ctrl 1 makes Logo stop scrolling until Ctrl 1 is typed again

* Ctrl A moves cursor to beginning of line

* Ctrl CLEAR deletes text from cursor to end of line

* Ctrl DELETE erases character at cursor position

* Ctrl E moves cursor to end of line

Ctrl F devotes entire screen to graphics

Ctrl Insert opens a new line at cursor position

Ctrl S splits screen: top for graphics, bottom for text

Ctrl T devotes entire screen to text

Ctrl V scrolls screen to next page in editor

Ctrl W scrolls screen to previous page in editor

Ctrl X moves cursor to start of edit buffer

* Ctrl Y In editor, inserts contents of delete buffer.
Outside editor, inserts the last command

Ctrl Z moves cursor to end of edit buffer

* DELETE erases character to left of cursor

ESC completes editing and exits to toplevel

F1, F2, F3, F4 cursor control keys that can be programmed

* RETURN completes line and moves cursor to start of next line

* Shift DELETE deletes text from cursor position to end of current
line

Shift INSERT opens a new line at the current cursor position

\ (Backslash) tells Logo to interpret the character following it
literally as a character rather than keeping some
special meaning it might have. You have to backslash
[,], (,), +, -, /, =, <, > and itself.

SYSTEM REBOOT reboots Logo, erasing memory space

From: jeking@xmission.com
Message-ID: <3jb547$nu0@news.xmission.com>
Source record: 93799

Help! I've been online the FlightLine BBS quite a few times, downloaded QWK packets, replied to messages
and uploaded my reply packet, only to find that FlightLine refused to understand what area they belonged
to.

FlightLine BBS users.. What QWK door format are you using to communicate on the Internet via PabQwk?

Any help appreciated.

Source record: 93801

Many years ago I gutted my 600xl of all its IC's. well, um...
I want to put it back together and do the 64k upgrade...problem is
I don't have ANY diagrams of the 600xl internals. I made a bunch
of guesses by tracing an 800xl board but all I get is a nice black screen
so..could some KIND soul please email me all the chips numbers for
all the "U"'s on the silkscreen.
Thanks.

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <134214@cup.portal.com>
Source record: 93804

```
BK=>: CW=>;
:It's all in the "="'s part. : Cool, huh?

;Not really. I sometimes like to define preset integer's, with this it is a
;two step process, declare and define.
Actually, it is pretty neat, you just aren't familiar with the syntax. For
instance;
Byte a
implies a byte type variable anywhere the compiler decides it wants it with
out clearing it.
Byte a=82
implies a byte at memory location 82 without modifying it.
Byte a=[82] does not mean a byte array of 82 elements as you may think from C
programing, it means a byte type variable anywhere the compiler decides to
put it with an inintial value of 82.

: At least ACTION! is smart enough to know where commands end, UNlike C..;

;Action! does the same thing that C does, and so does BASIC, and Pascal,
;but they all use different methods, Action! uses the EOL character to
;seperate commands, C uses the semicolon, BASIC uses the colon, and I have
;no clue what Pascal uses. But I am willing to bet that Action! isn't
;smart enough to know where commands end, go ahead and try to do something
;like a FOR-NEXT loop without ever pressing an EOL and put an IF THEN
;all on the same line. It will probably complain of a syntax error.
Nope, it seems like Action! uses DO OD type loops to verify, imagine the
ability to just write a big equation with, (x=x*10(y=y*10(if x<y then(x=Y)))
with the only thing checked for is white space & balanced (). Replace the '(
with something like "For N=0 to 10 DO" & the ') with "OD" & you'll get the
idea. In other words, Action! gives you more of the ability to be stupid
then even C. I have had the parser give me a "Too complex to figure out what
the hell you want" kind of message before, but I think it was more my
programing then the compliler. The only limit is the maximum line length for
Action! because of the way it's written, 255 characters. If the authors
would have wanted to, I'm sure they could have made it accept more. You can
use the colon operator for clarity i.e. Put('a):PutE(), but it's optional.

;This is just a guess, but I am sure of it. C uses the semicolon to
;seperate commands, so you can do something like this all on one line:
;for(p=buf;*p!=0;p++); p--;
;Which would have p pointing to buf, find the NULL (assuming it's an array
;of char's) and point to the last char in that array of chars, so it would
;be pointing to the 'd' in the above line (in the word would). I guess it
;was designed purely for that reason, you actually don't need ANY EOL chars
;in C, you could code like that if it makes you happy, but the code looks
```

;pretty disgusting. But I don't really know of any programming language
;that can for FACT distinguish between a command or a syntax error, most
;languages would produce a syntax error. Even an assembler would.
OK, once again, it looks like you just aren't familiar with the syntax, think
colon in Action! where you'd think semicolon in C & instead of the '*
operator we use '^. Another caveat is ! means NOT in C & virtually everywhere
else in the world *except* Action! where it means exclusive or, we have to
use <=>. Assuming everything is properly declared elsewhere
p=buf while p^<>0 do p==+1 od p==-1
which works just as well as
p=buf:while:p^<>0:do:p==+1:od:p==-1:
or
p=buf do p==+1 until p^=0 od p==-1
;Just remember, I am not trying to rag on Action!, I was never intending
;that, but we were trying to establish something along the lines of what
;is the easier to use, and I was trying to make the point that it is more
;of what you already know. Like C is easier for me to use than assembler
Good point & unless your willing to part with $50 of your hard earned money +
shipping as well as a large portion of your free time over the next year, it
wouldn't make sense for you to switch. Doesn't bother me at all you like C.
One of the reasons why I stick with Action! is we never really got into the
silliness you find in every other language. For example, have you ever tried
to wade through the BASIC code for something like AMIS? After looking at a
printout with a felt tipped pen to help me identify the loops, subs, pops,
goto's I honestly gave up. C prides itself on being arcane. You just have to
look at the contest they have for who can write the most obscure C program &
you get an idea of some of the goofyness people think is cute. Charles
Marslett is a great programmer in anybody's book, but looking at UTIL.C, I
find there's at least one outright mistake and maybe 10% of the routines are
never reached. When I program in C it's with one hand on my clones on/off
switch because I have a real tendancy to expect the worst. Sometimes it seems
like there aren't a dozen other Action! programers left in the world, but the
claim to fame right now is who can right the clearest self documenting code
rather then the most convoluted. It's more fun to talk with 10 people who
are speaking the same language then book a room in the Tower of Babel. C's OK
though, I may join you there if both my Action! carts burn out. BTW: I have
LightSpeed & it's the best for an integrated environment, C65 is good for
compatibilty but is the old style
[edit,compile,edit,compile,edit,compile,link,edit,compile,link,done] so it
takes a while to get something finished. I've never written anything useful
in C on the 8 bit, but damm little in Action! for that matter<g>. Rick

1985. 7800 monitor output?

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-05 08:42:00 UTC
From: cp576@cleveland.Freenet.Edu
Message-ID: <3jbtgo$kui@usenet.INS.CWRU.Edu>
Source record: 93655

Does anyone know how to add a composite
video and audio output to a 7800? I suspect
it would take the additional of only a
few components. It currently mostly sits
in a box because it only has TV output.
I would like to play Galaga and the other
games more often. Anyone know how to
connect a Nintendo Light Gun. I tried
several things but never had much luck.

Ken Siders

1986. 1050 problem

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-05 08:42:40 UTC
From: cp576@cleveland.Freenet.Edu
Message-ID: <3jbti0$kuo@usenet.INS.CWRU.Edu>
Source record: 93802

I have had a problem with my 1050 for
sometime. When then drive is being used
a lot (running, not just on), it
will do bad writes and formats. If I
turn it off a while, and try again it
works fine. What would be the most
probable cause? The voltage at the
voltage regulators seem to be fine,
I replaced the mechanism a while back
for another reason, and it did it with
bost mechanisms. I replaced two of
the filter caps because they looked
a little corroded. I would suspect it
is either the floppy controller IC
or is there some external components
between the floppy controller and the
drive heads envolved only in a write
operation? I currently am able to
survive with this problem since I know
about how long before it will start
acting up. It is mostly a problem when
I want to copy several disks that keeps
the drive running for a long time.
Any suggestions will be appreciated.
I have a spare non working 1050 board
I could try swapping the 2793 ICs.

1987. autorouting algorithm?

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-05 08:43:46 UTC
From: cp576@cleveland.Freenet.Edu
Message-ID: <3jbtk2$kv2@usenet.INS.CWRU.Edu>
Source record: 93656

I was working on a PC board layout
program a few months back and was going
to come back to it. Does anyone know
of any algorithms for auto routing PC
connections. Currently all I have is the
ability to drop down lines and parts
such as different DIP ICs. It is in
scrolling graphics 5 type display that
I was going to make switchable with
a graphics 7 type display. It uses one
color for the top, another for the bottom
and a third for both. It uses 50 pixels/
per inch which is a little crude but
detailed enough. I have been slow at
adding printer output since pin 2 on
my printer doesn't work.

1993. different graphic modes in the same scanline

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-05 14:52:37 UTC
From: CONRADUS@PLEARN.EDU.PL
Message-ID: <199503051452.IAA03998@mail.cs.utexas.edu>
Source record: 93775

>>The trick used by Our5oft is very simple:

>>1) we are waiting for desired scanline
>>2) then we use some NOP's as delay into scanline
>>3) we are swichting on the GR.9 using GTIACTL (called GPRIOR) register
>>4) then we use some NOP's again
>>5) then we are switching GTIA back to the GR.8 (in the same scanline)

>>The GTIA-chip becomes "stupid" and produces GR.15.

>There's one thing I don't understand. Does the CPU really get access to
>the bus after mode 9 or 8 has been switched on? I though it had to
>wait for horizontal blanking. But if that is the case, the CPU cannot

The CPU really waits for horizontal blanking, but only if you requested
it by writing something to WSYNC. Otherwise the 6502 works normally.
Simply try the technique mentioned above. It works.

>access the control register and switch to a different graphics mode
>before the scan line is finished.

It's been a while since I d/l'ed a new demo, but the last one I tried
was Cool Emotion. I just came across it yesterday (believe it or not) and
its pretty cool. I didn't check the whole thing out, but I think I had a
problem with one of the parts locking up on me. Anyone else want to verify?

1999. Re: Does MYDOS use file#'s?

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-05 19:14:05 UTC
From: bmarcum@iglou.iglou.com
Message-ID: <D4zErI.26J@iglou.com>
Source record: 93665

For compatibility with DOS 2.0 and other DOS's, Mydos uses file numbers
unless (a) the disk was formatted with more than 720 sectors or (b) a
certain bit is set in one of the aux bytes when the file is created.
This should be in the TECH.DOC file that comes with Mydos.

It reads disks, but gets garbage when you do a directory? Maybe the
track 0 sensor is out of adjustment and it is reading the wrong track.
Or maybe it isn't spinning at the right speed. Do you have an RPM test
program?

Have the following Atari 8-bit or 8-bit compatible stuff for sale:

1 Star Micronics Gemini 10X 9-pin parallel dot matrix printer in excellent condition with user's manual, original box, styrofoam and roller.-> $25

1 Atari 410 Cassette Recorder/Player in original box, with manual, cover and in excellent working condition. ----------> $5

1 Practical Peripherals 2400 baud modem with power supply and manual ----------> $20

1 Practical Peripherals 9600SA 9600 baud v.32/V.42bis modem with power supply, and full set of manuals. ----------> $40

1 Anchor Signalman MK XII 1200 baud modem with telephone cord, power supply, and instruction manual in original box and styrofoam. Has a built-in interface cable ----------> $10

1 GameMate 2 Remote Joystick Controllers. Comes with two remote control standard Atari joysticks with receiver unit and power supply. --> $15

1 Atari 850 Interface with operator's manual, power supply, and I/O cable. Can be used for up to 9600 baud speeds. Built-in parallel printer interface. ----------> $30

1 brand-new Atari Trak-Ball in unopened box ----------> $5

1 U-Print Model Universal Parallel Printer Interface with manual. Does not require a separate power supply. Plugs into I/O port and comes with a built-in I/O port for daisychaining. ----------> $10

1 1050 Disk Drive with Lazer upgrade (Happy-like clone). Double-density (180K) and high-speed operation. Has brand-new TANDON drive mechanism. Compatible with U.S. Doubler, and works with single, dual, and double-density disks. Comes with instructions and support disk.--> $65

1 PENGO Cartridge game in box shrinkwrapped ----------> $3

3 Your Atari Computer - A Guide to Atari 400/800 Personal Computers book (This is THE classic reference manual!) ----------> $2.50 each

You pay shipping.

I don't know about the KP, but the others connect to SCSI drives, or to
MFM drives using an Adaptec 4000 board. The Adaptec board costs about
$70, but a lot of people use it because (a) MFM drives are cheaper and
easier to find (or were a few years ago), and (b) the original MIO only
works with drives that can be formatted with 256-byte sectors. Many
newer SCSI drives only allow 512-byte or larger sectors.

2007. Re: BASIC rev C

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-05 23:00:36 UTC
From: winston@merk.com
Message-ID: <D4zp92.7wH@merk.com>
Source record: 93760

Actually, that would be a nice program to have -- some program that using peeks and pokes could tell if you had:

1.) BASIC A, BASIC B, BASIC C, some language cartridge installed.

2.) Had a CTIA or a GTIA.

3.) Sent a status request down the drive channel and figured out what type of drive was connected by what was returned.

4.) Could ascertain whether OS A or OS B was running.

5.) Could figure out whether it was running on an ATARI 400, an ATARI 800, an ATARI 1200, an ATARI 600, an ATARI GS.

6.) What DOS it was being run under -- SPARTA, MYDOS, ATARI

7.) Available joystick ports not being used for hardware latches.

8.) What type of 6502 CPU chip was in use.

9.) If a double POKEY Gumby upgrade was present.

10.) How much expanded RAM was available.

11.) Whether or not an OMNI board was present.

12.) Whether the machine had a MUX chip present.

...etc.

I have seen programs for the INTeL 80xx class machines that you would run and they would display a status report of the machine on the screen. It would be nice if you could take an ATARI 8-bit home from a flea-market, hook it up, and just run a diagnostic program to see if it was Bukholtzed, RAMBO-ed, OMNI-ed, Freezer-ed, and what was there on the inside.

2008. Re: Does MYDOS use file#'s?

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-05 23:31:14 UTC

Message-ID: <3jdhk2$912$2@mhadf.production.compuserve.com>
Source record: 93782

The question has two answers: when loading MYDOS at boot up, the links
for the DOS.SYS file are chased by code patched when MYDOS was written to
the disk (hard coded) and it could be either 10-bit links or 16-bit links.

Next, I'll assume you are talking about 4.5 (or later if Bob Puff has done
more with MYDOS lately), since prior to 4.5 the kinky DOS 1 linkage was also
supported....

If the disk has the MYDOS (DOS 3) format code set in the bitmap sector (that
is, if the drive has more than 1023 sectors), then a 16 bit length is used
(and there is no file number in the data sectors). If the last sector
on the disk can be represented in 10 bits, then the format code is left as
a 2, and the linkage field is exactly like Atari DOS 2.

Older versions of MYDOS also supported mixed format drives (the real flag
controling which type of linkage is used is bit 2 of the flag byte for each
file) so you could force a file on a disk with 1400 sectors to be written
as a DOS 2 file if all its sectors were in the first 1023 sectors on the
drive... (I got pretty fancy back then!)

>> : ROM calls and then insert replacement joystick routines, and handle the
>> : second fire button.

The 5200 lacks a PIA, but the custom chips are the same. And most of
OS routines are gone (went from 10K to 1K).

>But! I wonder about the actual license to make the game. I think rights
>had to by purchased from Nintendo. For every *video game* of the era,
>the carts were all made by Coleco, who made the best bid. However, as
>far as I know, the Atari 400/800 was the only *computer* to get the
>game.

Untrue. Many computers were supported by AtariSoft. DK came out on
cartridge for the TI99/4A and VIC-20, disk for Apple II, C-64 and
others. (Apple II version by Michael Cranford, later did Bard's Tale)

>Then, the fact that (as mentioned above) most 400/800 games were
>modified for 5200, I wonder if they were allowed to "fudge" a 5200
>version...despite it's being a "video game" of which the rights to DK
>would have been to Coleco. Perhaps there NEVER WAS a DK for the 5200.

There was no 5200 Donkey Kong released officially. Coleco
made DK (Super DK) for the Adam, and Atari wasn't happy.
Read David Sheff's "Game Over" for details.

>The 5200 is probably the only Atari system that I really don't care if I
>own. The games are all the same as the 8-bit computer (although fewer)
>and (as mentioned above) the controllers break. I remember being at the
>Atari store (in Alaska - when there WAS an Atari store) and seeing large
>stocks of 5200 controllers sell out.

There were several 5200-only titles not released for the computers
officially: Berzerk, Countermeasures, Gremlins, Jr. Pac-Man
(prototype), Kangaroo, Space Dungeon, Vanguard and Xevious (prototype).
Plus alternate versions of Qix, Space Invaders, Centipede and Mario Bros.
They were "transported" to the computers eventually.

>Well...I'm getting a little off topic here, but what about the 7800? How
>much of the guts of that thing are 400/800/XL?? I think there's a

>shots I remember seeing in advertising looked just like Atari8 screens.

No home computer guts other than the 6502C. It was based off the
2600 internals. There were plans for a computer add on with an
SIO port for compatibility with peripherals.

The 7800 version of Ballblazer has fewer jaggies. It does look
alot the same. Rescue on Fractalus was never completed, according
to one of the programmers.

2014. Re: 130xe programming

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-06 03:02:25 UTC
From: cmwagner@gate.net
Message-ID: <3jdu01$1hdk@tequesta.gate.net>
Source record: 93767

In article <3j6g0u$946@nic-nac.CSU.net>, kendrick@zippy.sonoma.edu wrote:
: In Action!, the following is FINE; it cares NOT and compiles perfectly:
: proc a() byte b for b=1 to 10 do printbe(b) od return

That is pretty scary. C, as far as I recall, can't do that, unless it is seperated by semicolons, like

```
void a(void){char b; for (b=1; b<11; b++) { printbe(b); }; return;}
```

which is the same as:

```
void a(void)
{
char b;

for(b=1; b<11; b++) {
printbe(b);
};

return;
}
```

But I would think that there would be cases where that kind of processing could get you into trouble, maybe an accidental space, and you just created two different functions, that may or may not exist, let's say they do (what are the odds? Pretty great, I bet), then it would call both and maybe never be aware to the programmer, racking you brains trying to find it, ugh what a nightmare. But I bet the odds are pretty great.

: I actually never use value assignment when declaring; I usually do the
: set just before the code which is about to use it; for example, in my

But I guess that would be one of your habit's, mine is to define and declare at the same time, saving the chance of the compiler not optimizing something as simple as that.

Tried an rpm program, it wouldn't read the disk, so no go. The track 0
sensor may be the culprit, I just ordered one.

From: jeking@xmission.com
Message-ID: <3je2q8$lqr@news.xmission.com>
Source record: 93791

Whats the freaking problem at umich? Not only does it take 3 weeks to get online now-a-days, but when I try to access the /New directory to upload my files, it says PERMISSION DENIED.

What gives? Where the hell am I supposed to upload to?

Until I can get the files on an archive, I'll just put them in my own FTP site at:

ftp.xmission.com /pub/users/j/jeking/8bit/DOM

Give me a day or so, as I'm having problems locating my own FTP dir <grin>

: CW>like pointers, which come in handy very often.

: But doesn't Pascal have pointers too? (Sorry if I'm getting my
: languages mixed up...) Pascal really forces you to be structured, which
: is quite different than C where it seems like you can get away with almost
: anything!

Pascal is a strongly typed language. Among other things, it requires strict
data typing. In C, you can cast your way around just about anything.
Pascal doesn't allow it as easily. Also, unlike BASIC, Pascal requires
declaration before usage of everything. In C++, for example, you can
declare variables anywhere, including within the block of program code.

C is more flexible. But that also gives you a much greater chance to
shoot yourself in the foot. I've seen even very experienced C programmers
forget to dereference a pointer, for example, and totally foul up a
program--even crashing the system.

But yes, Pascal does have pointers.

2022. Old Timer Seeks Insight & Help!

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-06 05:48:59 UTC
From: steveg@phantom.com
Message-ID: <3je7ob$nka@dockmaster.phantom.com>
Source record: 93779

I was really into the 8-bit Atari scene from about 1979 'till around 1986 or so, and then I was only mildly into it from '86 to '88 then just about dropped out altogether. Therefore, I'm not completely alien to the 8-bit scene but I have been out of it for awhile, so bear with me. :-)

I have a very well configured 800XL system sitting dormant in my basement in New Jersey. I live and work in Manhattan (with Macintosh computers) and haven't got the room in my little apartment to bring my 8-bit with me. I also have - surprise! - an extra, unused phone line in New Jersey. Let's see...Idle Computer + Idle Phone Line = BBS, if I'm not mistaken. :-)

So yeah, I've decided to let my computer chug along indefinately as a sort of "last refuge" Atari 8-bit BBS. Here's where I need the help of all you folks.

My current system is as follows: Atari 800XL (RAMBO XL 256K, function keys, coldstart switch), three 1050 disk drives (one stock, two modified with US Doublers), Atari 1010 program recorder (useful, as you all know), Atari 1020 plotter, Atari XEP80 80-column card, ICD PR Connection (with an HP ThinkJet printer and a Hayes Smartmodem 2400 connected to it). A 13" Magnavox monitor provides the typical Atari color display and sound, while a BEC green screen is connected to my XEP80 and provides clean video for that. I also have the typical assortment of a few hundred floppies, a couple dozen cartridges and a good assortment of game controllers.

I also have two 20-MB SCSI hard drive mechanisms which I'm holding on to in hopes of connecting them to the 800XL for BBS usage. (If this thing gets popular at all, I have no problem with buying a much larger hard drive for the BBS.) I also have no qualms about buying a good 14.4K baud modem for the BBS; I figure downloading an 8-bit program at 14.4K baud would be rather nice. :-)

SO...With all that in mind, here's what I'd like to do. I figure on purchasing a PC-type mini tower case and making a few little modifications to it to accomodate the hard drives. If possible, I'd also like to install a tape backup of some sort to provide the occasional system-wide backup protection - though this may not be feasible, considering that I likely won't see the machine more than once per month, tops. Once the mini-tower case is in order, I should be able to connect it to some sort of SCSI interface box for the 800XL, format the disks with SpartaDOS, and off I go.

I will also want to invest in an RTime-8 cartridge (are these still around?!?). And it's been mentioned that SpartaDOS 3.2 (3.2f?) will fit my needs nicely, though an excellent version of SpartaDOS is available on

cartridge and would be better. How true is this part?

I understand that what I really want is something called a "Black Box" which will enable me to connect my SCSI drives to the 800XL. (I use SpartaDOS and nothing else, so that's not a big deal.) This "Black Box" will also, apparently, allow the 800XL to work reliably with a high-speed modem as the PR Connection won't reliably work with something faster than 9600 baud (or so I'm told).

I'm assuming that, so far, I'm not doing anything out of the ordinary. Therefore, the only other issues are software and getting the word out. The last time I was into Atari 8-bit BBS's, BBS Express! was The Program To Have - and, indeed, I have an old copy of it. However, I'd like a bit more from the program - namely, the ability to work not only in 40-columns in ASCII and ATASCII mode, but *ALSO* the ability to work in 80-columns in ASCII and ATASCII mode. The IDEAL situation would be to have software that would be (a) smart enough to know when a caller is using ASCII or ATASCII; (b) smart enough to know that, once a user is connected, that user prefers a 40-column or 80-column display, and (c) smart enough to use the appropriate display on the host system (my system). A "really nice" thing would be to have all BBS activity show up on the 80-column screen, while reserving the 40-column screen to show user stats, user preferences, system information, etc. I don't know if Atari 8-bit BBS software is this advanced or not; this is simply a "would be nice" list. So what would be my best bet for BBS software?

FINALLY...Aside from this newsgroup, how the heck should I spread the word once the system is up and running? :-)

Please send replies to mail. I'm looking for sources to buy the things I need, answers to the above questions, potentially better alternatives, etc. My system, once configured should be able to run with little personal attention from me. (I'll be assigning a few sysops to run things for me, like validating users and the like.) If the power gets cut at my house, it should be able to restart itself when the power comes back on without anyone at the keyboard (I figure I can take care of this with a few SpartaDOS batch commands). Thanks! :-)

Wait, did you say you think adding an extra space in >Action!< might cause
it to make two functions (or something) or that it's a great danger in >C<?

In Action!, it does pretty much like HTML does to spaces/EOLs, it collapses
them.

EOL = SPACE
SPACE SPACE = SPACE

In HTML, the following

hello there how
are you

doing today !?!?!

Would be displayed as:

hello there how are you doing today !?!?!

I THINK though that EOL's in the MIDDLE of a statement like:

PrintE(
"hello")

might not work, but, well, lemme try it...

nope! it works fine! :) I'm sure something like:

A=
5

won't work.. oh my god I was wrong!!!!!!!!!!!!!!!!!!!!!!

Oh wait, of course; I've seen code like this before:

```
A = 5
if (a = 5) then
printbe(5)
fi
```

anyway... I guess you get the picture; the compiler is a damned INTELLIGENT
piece of code!

Sub: NEAR*US Meeting

The journey of NEAR*US continues.....

February 25, 1995

Dear Fellow Atarians,

On December 3, 1994, representatives from several user groups, BBSes and a few Internet Surfers meet on Long Island to discuss the future of the NORTH EAST ATARI REGIONAL * USER SUPPORT group. The discussion lasted for several hours. The formal meeting was forced to end as our meeting place was closing.

The purpose of this unofficial meeting was twofold. We wanted to evaluate the feelings and needs of the Atari Community in our region. We wanted to determine if there was enough interest to revitalize NEAR*US.

The discussion and attitudes were surprisingly positive and constructive. The group displayed a realistic attitude that showed the community is reaching a higher level of maturity. The hopes and dreams have been tempered by years of disappointments and unfulfilled promises. As time passes, the Atari community is decreasing in size and becoming increasingly isolated and fragmented. There is a clear realization that the future of our computers rests in our hands.

As the discussion continued, several points became clear. The most evident is genuine support for the revitalization of NEAR*US. The nature and scope of the group must change to meet current needs. Even our name may change to better represent our new directions.

The discussion took many paths but increasing communication was the central theme. The community has many problems and needs. With the deceasing size of our user base and dominance of other computer platforms, isolation is increasing. The Atari community has always

been fragmentated. The need to pull together is greater than ever.

What are our plans... our ultimate goals? Where will the journey take us? I wish there were concrete answers to these basic questions. We are still in a reformation stage, formulating a new strategic plan based on our actual resources. We need to be a dynamic group, changing with needs, resources and goals.

Several concrete decisions were made at our December 3rd meeting. The first and most important was to continue! The second was to open the group to all interested Atarians. This includes user groups, programmers, developers, non-pirate BBSes, and any interested users. New avenues of support, including the Internet, are being investigated. We are expanding the NEAR*US Net to non-user group BBSes.

On March 11th the journey will continue in Plainview, New York. We will build on the existing camaraderie. Our goals will be further evaluated and a plan created for the remainder of 1995. A few committed volunteers are needed to work together in leading NEAR*US. We will stay open minded to any suggestions that may help support the needs of our Atari community.

In any group or organization, people are the most important ingredient. Our December 3rd meeting included a very diverse group of committed users. Everyone present gave of their time, resources, opinions and suggestions. The value of every individual was felt by all. For success, we must continue to recognize the value of each participant's contribution.

It is with anticipation we look forward meeting again on March 11th. We know our journey is a difficult one. However, even the longest and most difficult journey can be accomplished one step at a time..

Sincerely,

Jonathan C. Mordosky
NEAR*US Interim Chairman

If you need further information, please feel free to contact me at the following:

on GEnie: J.C.MORDOSKY
on the Internet J.C.MORDOSKY@genie.geis.com
on the IAN & NEAR*US Nets: Jonathan Mordosky
on ACUTE BBS (610) 261-0620: Feedback to SysOp
via US Mail: Jonathan C. Mordosky
P.O. Box 796
Whitehall, PA 18052-0796

What is NEAR*US?

NEAR*US is an association of 8/16/32/64 bit Atari users. It is in a process of reformation. It is non-profit and self-funded. It is not

affiliated with Atari Corporation, its subsidiaries or any commercial enterprise. We do not support piracy either directly or implied, or the use of computers for any illegal activity. A short history and more information can be found on GEnie and many BBSes. The file name is listed as NEARUS.TXT and dated about 11/94.

NEAR*US Post PreOrganizational Meeting

Saturday, March 11, 1995 - 11:30 AM to 5:00 PM

Plainview Library
999 Old Country Road
Plainview, New York

The Plainview-Old Bethpage Library is located in middle of western Long Island in New York. It is located on a major roadway and is easily accessible from major highways.

Directions from the Long Island Expressway:

Take the Long Island Expressway to Seaford Oyster Bay Expressway (Rt. 135). Take the Expressway south to Exit 10 (Old Country Road). Travel east on Old Country Road about four (4) blocks, the library will be on the right. It is a large library with a parking lot in front. Across the street is a large shopping area. The meeting room is in the basement.

Directions from the Southern State Parkway:

Take the Southern State Parkway to Exit 28AN, the Seaford Oyster Expressway. Take the Expressway north to Exit 10 (Old Country Road). Travel east on Old Country Road about four (4) blocks, the library will be on the right. It is a large library with a parking lot in front. Across the street is a large shopping area. The meeting room is in the basement.

Light refreshments will be provided
Courtesy of Ol' Hackers Atari Users Group

About our host for this meeting:

Ol' Hackers is the largest and best known Atari 8-bit user group in the United States. It is headed by Alex Pignato, and has members throughout the world. This past year it was forced to limit new membership. The expanding membership had taxed the limits of its resources. There is much to be learned from Alex and the Ol' Hackers.

We encourage you to pass this file on provided it remains unaltered in content and completeness. Atari is a trademark of Atari Corporation and is not affiliated with Ol' Hackers or NEAR*US.

Spread the word and bring a friend!

=END=

For someone who has been out of the Atari 8-bit scene, you sounds to me like your almost on top of it all!!

Looks like, in my opinion, your set as far as putting up a bbs, but the only thing is software.

Depending on how complex you want to get, I would recomend the software that I run my bbs on. It's still called BBS Express, but there have been many changes to it.

First it is now called BBS Express Professional (most call it PRO for short), and if you liked BBS Express, your going to LOVE this beast!!

It's fast, it's good, it'll do all the video you mentioned, and in fact, here's a list of video translation modes it supports (40 or 80 columns):

ATASCII, ASCII, ANSI, VT-100, VT-52, CGS, IGS. IGS was developed for the ST, but it didn'T seem to catch on (at least I haven'T seen IGS graphics -- anyone else??). CGS is for the 8-bit, and it is a step up in bbs7ing for the 8-bit. You can get many of the 8-bit's grphics modes operational while online if you have the CGS package for Bobterm (does anyone know if there was ever a term proggram released that incorporates CGS within the program itself?), and with you only seeing the computer once a month, if your power is stable, and have good equipment, the board will take care of itself.

It can be a long process to get the bbs the way you want it to "look", and there are many steps that must be taken to get the bbs set up, but the process is not overwhelming, and is a little time consuming, but what great project isn't?? It's a module type bbs, and that makes it flexable. There are still quite a few Atari boards around the country, so support or assistance comes easily.

If you have time, call my bbs: Warp 10 BBS 612-221-9895 (300-14,400 baud), and I'll take you for a tour of my system, and give you all necessary information.

Joe Walsh (ransom22@delphi.com) wrote:
: "Why are you restricting yourself like that?" Now I can give them
: a good, accurate answer. In restricting ourselves (I'm talking about
: programmers here) to the 8-bit Atari, we are helping ourselves to
: produce works of higher artistic value, and we are pushing ourselves
: harder than those who indulge in the full, unfettered worlds of the
: current crop of microcomputers (with megabytes of RAM, hundreds of
: megabytes of disk space, horrendous speed, etc.). Those that program
: on the IBM, Mac, etc. platforms do not need to push themselves. THey
: can solve all problems with brute force and the user will be none
: the wiser. On the other hand, we must constantly push ourselves,
: compacting our code and making it as terse as possible.
: In short, we 8-bitters must go about our work much more
: imaginatively. Just like the author of the book cited above.
:

Of course, it could be said that modern computers like that could help us
develop better 8-Bit Atari games. If I could get that Amiga to 800XL via tape
program working at an acceptable speed, I could do lots of cool graphics!

What the world needs is a new age.
What the world doesn't need is New Age.

PATERSON, DAVID ANDREW (da_pate@pavo.concordia.ca) wrote:
: I've seen 1029s in Canada. They seem to be an improvement on the 1025, since
: the 1029 does support bit mapped graphics. Never actually used one myself,
: though I do have a 1025.

Funnily enough, *I've* heard very little about the 1025- the other way round really. The 1029 seemed reasonably ubiquitous in the UK at least, but it didn't work with a lot of programs (which were mainly developed in the US, where the 1029 wasn't sold, and there wasn't really any support). Another reason was that it wasn't Epson compatable, it had a different number of pins, which would have made reqrites difficult.
As far as I know, it used the same mechanism as a Commodore printer of the same era.

What the world needs is a new age.
What the world doesn't need is New Age.

For what it's worth, Adaptec boards, both the 4000A and the RLL
version, the 4070A, are currently listed in Timeline
(800-872-8878) ads at a price of $40 each.

No relationship to Timeline, just a previous customer.

2035. P:R:Connection modem cables

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-06 15:47:23 UTC
From: KENDRICK@sonoma.edu
Message-ID: <950306074714.2040b235@sonoma.edu>
Source record: 93798

I just got a P:R: yesterday and tried using it but unfortunately I
guess my standard (I think!?) RS232 cables / 25-9 converter aren't
correct for it.

I did it like this:

```
Atari -> P:R: -> SIO2PC -> PC
\
`-> 25-9 -> 25cable -> 14.4k
```

I take it I need an "official" P:R:Connection / Atari 850 interface cable?

Where can I get one!?

thanx!

Has anybody downloaded the demo version of GTRACKER from Umich yet?
The filenames are GTRACK1A.DCM to GTRACK2C.DCM, you need all eight
files for diskcomm to turn them into a full disk. Its in the demos
section.

Would somebody please confirm that the files work (or don't work) as
I have some more stuff to upload but I don't want to do this if my
upload procedure is not working!

The Cool Emotion demo is perhaps the best one I have yet seen, it
really has to be seen to be believed!

2038. Re: Port ST Xformer to Falcon

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-06 18:50:14 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <95065.135014STIRRE31@MAINE.MAINE.EDU>
Source record: 93690

Rod,
I talked with the author of ST Xformer about getting it to run with
the Falcon. He was not interested in getting it to run but said
the source is available on some FTP sites and the job would be
relatively easy. Someone else expressed interest in porting it
but I haven't heard any news since. If you are interested in
working on this I could try to find the source code. I am not a
programmer and would have no idea how to do this (unless it
was written in Hisoft Basic :-)). I would _love_ to see this
program ported as I miss my 8-bit.

2039. Misc. Atari 8bit HW, $5+S/H

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-06 20:19:14 UTC
From: jml10@cornell.edu
Message-ID: <jml10-0603951519140001@128.84.224.148>
Source record: 93691
Cross-posted to: comp.sys.atari.8bit,cornell.marketplace

I have some Atari 8-bit hardware items that I'd like to try to get out of my closet. I note the condition of each item below: some will only be usable for parts, but if nobody wants them they get thrown out.

Each item below is $5 plus shipping costs. I'd like to sell them locally to avoid having to ship, so local offers will take precedence, but if no local offers arrive by Wed 3/8 (and I'm not holding my breath) the first person who contacted me gets the item.

1) Atari 1025 Dot-matrix printer: Works Fine.

2) Atari 1027 Printer: Mechanism works, but prints garbage instead of the desired characters.

3) 10 Meg SCSI Hard Drive: Worked last time I used it, about a year ago. Takes a LONG time to warm up but works fine once it does. Comes in a PC case that includes a power supply with an Atari 8-bit power adapter. (The guy I bought it from says it works fine but I never had the courage to try it). You will need an external adapter such as ICD's MIO or CSS's Black Box to use the hard drive. (Sorry, I'm not getting rid of my MIO yet.)

4) 1050 Drive with ICD US Doubler, minus power supply. One of the upgraded ROMs has a tendency to slip out of the socket. When it doesn't, the drive is a perfectly useable "true double-density" drive. When it does, well, life becomes much more sad. But the drive mechanisms work fine and should be usable for parts if nothing else.

Email me as jml10@cornell.edu if you're interested.

2042. Gore demo & Umich archives

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-07 02:50:40 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1995Mar06.214518.16704@wariat.UUCP>
Source record: 93695

I feel sorta funny about probably nobody has responded to R. Gore about the demos he's sent to umich archive. I gaurantee that J. Lenn has put them in the archive. But the thing is, I've tried 2 or 3 times to BART things from the umich archive and it doesn't bounce, doesn't send me the file, doesn't do anything, just gets lost in the Great Bitbucket of the internet. So, I don't feel much like trying to get stuff from umich anymore. I think I've even tried to get Princeton to bitnet FTP stuff from umich with no success. The bottom line is, if Mr. J. King has trouble downloading from umich and uploading, which he has posted problems trying, then I don't think I can do it. This is not a put-down of the umich archivers. I suspect the problem is higher up and/or the 8bit archive has been given 'junk' status, which means file requests get waste-canned. There are mirror sites, which, I'm sure the files eventually get to, but I think it is hard enought to figure this stuff out and just don't want to try that hard.

You can an "official" P:R or 850 modem cable from B&C but how about
making one yourself. Three pins are different from the standard PC modem
cable.

Get a CompuKit DB9 Male to DB25 Female Adaptor or equivalent and perform the
following pin modifications:

Male Female
DB9 DB25
1 20 (instead of the standard 8!)
2 8 (instead of the standard 3!)
3 2 (leave it!)
4 3 (instead of the standard 20!)
5 7 (leave it!)
6 6 (leave it!)
7 4 (leave it!)
8 5 (leave it!)
9 22 (leave it!)

Will need to use a soldering iron or just buy one from B&C!

In article <134214@cup.portal.com>, Rick_Michael_Cortese@cup.portal.com wrote:
: goto's I honestly gave up. C prides itself on being arcane. You just have to
: look at the contest they have for who can write the most obscure C program &
: you get an idea of some of the goofyness people think is cute. Charles

Well that is what some people think, and I have seen some pretty interesting
code that throws out interesting results, one I had a hell of a time figuring
out. But I don't care for that obsfucated C stuff, I like clear code, that
is straight forward, but pointers are not straight forward to beginners, but
I guess somebody has to suffer for my method of programming. <grin>

: never reached. When I program in C it's with one hand on my clones on/off
: switch because I have a real tendancy to expect the worst. Sometimes it seems

Well I have had one hand on the on/off switch also, but I feel it is well
worth it, the power and flexibility is worth the occasional simple
programming error that happens to corrupt the interrupt table, some RAM,
or occasionally format the harddrive. <just kidding on the last part>.

: takes a while to get something finished. I've never written anything useful
: in C on the 8 bit, but damm little in Action! for that matter<g>. Rick

I find myself having the knowledge and drive to write programs, but can't
think of a damn thing that would be useful. <sigh!>

Source record: 93807

In article <3jeddc$q3l@nic-nac.CSU.net>, kendrick@zippy.sonoma.edu wrote:
: Wait, did you say you think adding an extra space in >Action!< might cause
: it to make two functions (or something) or that it's a great danger in >C<?

Let's say there is three functions, testfunc, test, and func. I would guess
that if you accidentally threw in a space between test and func then it would
call both functions, in C it would give a syntax error. Or does Action!
require that parenthesis follow each function call, like C?

: anyway... I guess you get the picture; the compiler is a damned INTELLIGENT
: piece of code!

Your example:

```
A=
5
```

also compiles under C with this code:

```
unsigned char a=
5;

main()
{
printf("%d",a);
a=
6;
printf("%d",a);
}
```

It treats EOL's as whitespace, it doesn't care about EOL's, spaces, or most
of that crap, it is whitespace, it strips it out up until the semicolon,
so it interprets the program as:

```
unsigned char a=5;
main() {
printf("%d",a);
a=6;
printf("%d",a);
}
```

It's obvious that Action! has similiar processing schemes as C, which may
have been one of the biggest parts taken from C.

I know I have seen a review of the C64 version of Spelunker in
the mid-80's. The Atari version was disk only, while the C64
version was available on cassette.

Message-ID: <belitz.185.000F8011@genesis.informatik.rwth-aachen.de>
Source record: 93833

Hello !!!

Here's my problem again - my 800XE shows no color at all, but the GTIA is
o.k. (I have checked it out by swapping it with my 600 ones).
The voltage on the trimmer(R38) also seems to be correct !!!
What could be the reason ?
Please help !

Matt

P.S. Anybody here who had upgraded his 800 XE memory yet?

>following pin modifications:

I've got a couple more questions about the P:R: connection and 850 and
other stuff...

Can the P:R: connection daisy chain to the end of your SIO chain? I've
got an 800XL leading to a 1010 to a 1025 to a 1050 (soon to another
1050) to a 1030 modem (which someone gave me yesterday). The 1030, of
course, will be gone once I have the hardware to hook up something
faster.

If I used a P:R: connection for a faster modem (the 1030 only does 300
bps...arrgh), could I hook it into the second 1050 (which would then be
the "end" of the SIO chain) and then hook that into the 25/9 adapter
(which needs to have pins crossed, if I understand correctly), then
connect that to a standard RS-232 into the modem? And this can work
at speeds up to 9600 bps?

I need comm software, anyway. I have the 1030 and I can't even try it
out because I don't have the software. Guess I'll have to go to B&C
on Thursday and pick up one of those public domain comm packages to at
least get me started so I can download something better...but at 300 bps
it will take a *long* time [groan]...While I'm there, I may have to
look into biting the bullet and plunking down $50 for a P:R: connection.

2063. Re: 130xe programming

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-07 19:00:10 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <134367@cup.portal.com>
Source record: 93827

As far as writing something useful, I wasted a huge portion of my life writing a Basic interpreter for my clone. What happened was we only had about 6 assignments in the C class & I finished the 1st 5 in the 1st few weeks. The 6th assignment was an interpreter so I spent about 30 hours a week for the last 3 months writing it. The program listing looked like a small telephone book. The only good thing about it was it taught me to be a little more reasonable about where I spend my time programming. Ended up with a lousy implementation of what was a poor choice of languages to begin with. I remember at the time thinking I could write an exact clone of the basic for the Atari, you could do cross platform development. Just a silly assumption! I wish I had that time back now.

Source record: 93692

Sometimes the felt pressure pad above the head gets compressed,
through use and no longer pushes the disk close enough to the head
for a successful read/write. Don't forget we are talking tiny
distances here, the problem was most severe with writes and formats.
The solution I have seen published quite a few times is to simply
use the end of a paper clip to carefully rough up the felt pad.
Apparently this does the trick although I have never had the need to
do it myself. Hope that helps.

SPINDIZZY is Marble Madness clone, I think it was released in the UK
by Activision, but I could be wrong. The graphics are diagonal 3D
type displays (they are quite good actually), and you must guide your
'spinner' which can morph to other things around the maze looking
for..... ummm its been so long since I played that game I have
forgotten most of the story. Anyway it is quite good, well worth
buying if you can find it. Sorry I don't know where it can be bought,
do ATV, B&C or BEST have it? Anyway I hope that helps the person who
wanted some info on it. If you want more info let me know and I'll
dust off my copy and have a play.

Message-ID: <3jivoh$4fd@dockmaster.phantom.com>
Source record: 93696

Thanks to all who have helped me with my little pet project. You're all invited to the BBS opening - when it happens. :-)

I have another issue regarding SCSI devices and the Black Box/8-bit thing. Does the Black Box support removable media devices? I have a 44-MB SyQuest drive (SCSI) hooked up to my Mac, but I'll soon be replacing it with a different, higher capacity removable storage device. I was wondering if it would be possible for me to connect the drive to the 8-bit for BBS usage. This should be fairly cost-effective as I have about a dozen 44-MB SyQuest cartridges here which I can swap in but a few seconds if/when one cartridge fills up. So what's the verdict?

In other news...Here's another little problem which I forgot to mention when I last posted. A few months ago I was using my 8-bit system without a hitch. I shut everything down when I was done and left. When I returned a week or three later (remember, I live in NYC, my Atari is in NJ) my D2: was no longer functional. When you hit the power switch, the POWER light goes on but the drive doesn't spin. I opened up the drive and discovered two things: First, a floppy disk sticker had attached itself to a small piece of metal which is attached to a spring inside of the drive. Removing the sticker was easy and the drive didn't seem to be affected; I compared the drive to my functional D1: and they looked and functioned identically, barring the aforementioned problem with D2:. The second thing I noticed was that the vertical aluminum shielding that kind of wraps around the back of the drive's controller board was VERY hot (significantly hotter than my functional D1:), especially on the left side (the same side as the power cable input). Turning off the power switch and waiting a few minutes showed a marked cooling in the shielding, but it only takes a few seconds (about 10-15) for the shield to get hot again once the power is turned on again.

Any ideas? Oh yeah...This drive, as well as my D1:, are US Doubler-ified though I've never had a problem with it before. Nothing had spilled or otherwise gotten to the drive while I was away; it's covered with a plastic dust cover in a cool basement, with a functional dehumidifier working about 30 feet away, and I'm the only one who ever touches it.

2069. More ?'s :-)

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-08 01:08:09 UTC
From: steveg@phantom.com
Message-ID: <3jj01p$4fd@dockmaster.phantom.com>
Source record: 93697

Sorry, but I'm just full of questions. :-)

1. Is a special cable needed to connect a 14.4K baud modem to a Black Box?

2. What is the maximum storage capacity of the 8-bit Atari w/Black Box?
(I.e., if I wanted to connect, say, a 730-MB SCSI hard drive...?)
Following that thread, how are partitions designated (i.e., do we go from
D1, D2, D3, etc to D8, D9, DA, DB, DC, etc?) and what is the maximum
partition size?

3. I'd still be interested in hearing any ideas on how to promote the
opening of a new BBS. I'm considering dropping a few dollars into a
couple of ads in Atari-related newsletters. Does Current Notes still
exist, for example? What are the other popular mags around that won't
drive me broke for a simple little ad? :-)

2070. SpartaDos X ramdisk 9,15 problems

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-08 02:36:45 UTC
From: James King <jeking7@delphi.com>
Message-ID: <RWwb9VI.jeking7@delphi.com>
Source record: 93837

Finally got a 130xe to work on my MIO, but now that I want to use my SpartaDos X cart, I'm finding that adding DEVICE RAMDISK 9,15 doesnt do a damn thing. I can see it accessing the ramdisk (I installed the ramdisk LED hack), but doing a DIR D9: says invalid drive..

I can then do a RAMDISK.SYS 9,15 from the command line, and it works.

Any suggestions?

: faster.

Sure can but the preference is to keep it as close as you can in-line to the computer. You can then daisy chain from the P:R with its extra I/O port. Best to keep it closer.

Why should you keep it next to the computer in-line? The P:R Connection is powered by your computer and should ideally be plugged into the 13 pin male socket where the disk drive normally goes. Then plug the next device into the 13 pin I/O socket on the P:R Connection. Since there is actually a voltage drop in each of the daisy chained connectors, it IS best to plug the P:R directly into the computer.

: If I used a P:R: connection for a faster modem (the 1030 only

: at speeds up to 9600 bps?

Yep, plug the 9pin to 25 pin adaptor into R1: on the P:R and then plug in a standard 25-pin RS232C modem from it to your modem. Can use up to 9600 baud with the P:R. (Some have claimed 19200 but I have not seen that from any P:R I have used).

: I need comm software, anyway. I have the 1030 and I can't even try it
: out because I don't have the software. Guess I'll have to go to B&C

Just remember that the 1030 is a direct connect modem. You will need an actual modem to hook into the P:R. E-mail me if you are looking for a faster modem (like 9600 baud!!).

For comms programs, Check out Ice-T or FlickerTerm 80 for VT100 dialup emulation! Flickerterm has IBM-PC ANSI graphics capability too.

For 40 column ATASCII and 40 column ASCII or 80 column with the XEP-80 check out Bobterm. All are available on the net.

2075. Depression...and things from 1985

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-08 04:54:01 UTC
From: heller@akh104.rh.psu.edu
Message-ID: <3jjd99$fnf@hearst.cac.psu.edu>
Source record: 93702

From the San Leandro Computer Club, February 1985.

Excerpts from the Consumer Electronics Show in Las Vegas.

"Antic Special Bulletin"

" . . . the one sad note . . . the long-rumored AMIE 16-voice sound chip was not totally ready for production yet. The AMIE, which is said to emulate human speech and singing with unprecedented accuracy, will be incorporated into the '85 Atari line later in the spring . . ."

"Another '85 breakthrough is Atari's sleek, compact 3 1/2" disk drive with 500k storage capacity . . . in the incredibly low price range of $100."

". . . the monitors include a 12" monochrome for about $100 -- with a built-in 80-column card . . . and a 14" color monitor for about $200 which will compete with the popular Commodore color unit."

"There will also be a luggable 8-bit XE that comes with 128K, a small video screen and a disk drive, the package selling for around $400." [This was the 130XEP]

"Today's press conference was introduced by Nevada governor Richard Bryan, who has been negotiating with Atari President Jack Tramiel to establish an Atari semiconductor factory in Nevada . . . negotiations for such an Atari plant are going well . . . but have not been finalized."

also in this SLCC issue was the small little article "X-Atari Review" which had this to say:

"...Atari users should be up in arms at the death of the expansion box. This would have allowed all XL owners (1200 excluded" to upgrade to 128K, music synthesizer, and other neat expansion cards that now we are left without. It was only a heavy write-in campaign that saved the PBI . . . on the new high end 8 bit machines . . ."

" . . . a word about what Atari would have show; 800XL, 1450XL, Expansion box, a read-only optical disk drive utilizing Warner's record division to stamp out indestructable inexpensive software media . . ., a true double-density double sided drive, and lets not forget the ace in the hole, the Atari Amiga . . . a truly new machine in the spirit of the old Atari, not a color Macintosh clone."

and now I would like to wrap up this tear jerker with how I am feeling about all this stuff:

"Looking from this empty room, the corridors of endless gloom go
crawling through the night, to meet the dawn that's on its way.
Oh, to sleep, per-chance to dream, to live again those joyous scenes,
the laughter and the follies that are locked inside my head...."
Mr. Kingdom - ELO

The PR connection has an SIO cable and an SIO port. It takes its power off the
SIO line, so it's best positionned right after the computer. 1200xls requires
the installation of a jumper to work properly.

If you're looking for comm software, get BobTerm. It can be used with virtually
any modem/interface combination. Thus, you can go from 300 to 9600 by merely
changing the handler file loaded by BobTerm. You may also want to look at
the Zmodem DL program (Atari-Z-Modem?) at Umich.

>era.
>
The 1025 is built like the 800 - seemingly indestructible by anything short of a prolonged nuclear conflict. No graphics mode, only 7 pin text, with no descenders. Noisy and slow.

I once wrote a screen dump for the 1025. It was in BASIC, and worked with Graphics 5. The darkest color was dumped as #, medium as -, light as . and a space represented the lightest.

Of course, at that point I used looping LOCATEs, rather than anything faster; it was a painfully slow process.

>
>
Ben Poehland, better known as the arcane alchemist, has used a SyQuest with
a Black Box. I'm not sure of how the various DOS systems react to a change in
the media; I'd guess that as long as the drives are partitionned in the same
way there won't be a problem. Otherwise, you may have to power down / cold
reset to change carts.

One thing to keep in mind: all flavours of Atari DOS are currently limited to
16 megs (256 bytes/sector with a maximum of 65536 sectors). There have been
rumours of a MyDos 5 that breaks the 16 meg barrier, but I don't think it's
available yet.

: things from the umich archive and it doesn't bounce, doesn't send me
: the file, doesn't do anything, just gets lost in the Great Bitbucket of
: the internet. So, I don't feel much like trying to get stuff from

I think sometimes things get lost, as well. I sent a message through a
Fidonet gateway to my Internet account, thought it got lost, two months
later it was in my mailbox. No one said it would come the same day.
<grin>

So the point to the little story is that one day the file may appear in
your mailbox.

: has trouble downloading from umich and uploading, which he has posted
: problems trying, then I don't think I can do it. This is not a

atari.archive.umich.edu is seriously overloaded, since it not only handles
Atari stuff, but other stuff as well. I use gopher to access the ftp
archives, gopher.archive.merit.edu, it is much more responsive.

: requests get waste-canned. There are mirror sites, which, I'm sure the
: files eventually get to, but I think it is hard enought to figure this
: stuff out and just don't want to try that hard.

Yeah, wuarchive is supposed to be a mirror site, and it is usually an
excellent mirror of many sites, but for some reason (atleast when I last
looked) it didn't have an up-to-date mirror of aaue, which I suspect
wuarchive had the same problem that we do, couldn't login. Maybe umich.edu
is on AFS (is that what it is?), I don't think (nor have I found) AFS
is available from my provider, but you may be lucky, try a cd /afs from
your shell account (if you have one).

The problem with any Atari8 emulation endeavor is initiative. So far PCXformer is the most mature one and even that is incomplete. Supposedly the one for the Amiga is done or close to done but who knows how long Jim Drew will talk about it and not release it (I have been away from the net for a month so maybe when I pop into the Amiga newsgroup I will be pleasantly surprised). The Falcon was enough of a step up from the humble STs to probably be up to the task of 1:1 emulation but there are so few Falcons that I doubt any programmer would spend the time to do it.

From: krishna@primenet.com
Message-ID: <3jjt54$lsl@news.primenet.com>
Source record: 93812

Yeah, the XEGS upgrades aren't that easy, getting the RAM may be a
challenge. Going over 128K means stacking over 3 deep. It's easier to
get mega memory when you have 8 sockets to stack rather than just 2.

If only Atari had made the XEGS just like a 130XE replete with ECI/CART,
monitor jack, and standard memory configuration, it would be a VERY
popular machine with diehard users these days instead of a curiosity.

2086. Re: different graphic modes in the same scanline

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-08 09:30:11 UTC
From: krishna@primenet.com
Message-ID: <3jjtf3$lsl@news.primenet.com>
Source record: 93813

I don't know about modes, but I do know that as far as color registers are concerned, the Atari is barely fast enough to handle about 2 color register changes per scanline for a kind of predecessor to Amiga HAM mode. That's John Harris's GED system and it's cool to see since usually you don't think of the Atari as being accurate enough to be able to make steady changes in mid scanline. In fact John's earlier GED had a bit of instability and there was some wavering sometimes but his newest version is rock solid. There are even enough cycles left for joystick polling for rudimentary painting routines although in the text file for GED John talks about how while the Atari is doing this it has really nothing left to spare, which is what prevents this mode from being useful for anything but static displays.

2087. Re: diff. gr. modes per scan line?

: >than one graphics mode on the same scan line. Anybody care to speculate
: >how this was possible?
: If it's the one I'm thinking about, then close inspection reveals them to
: be GTIA modes + Gr.8 I think. If I remember correctly you can switch GTIA
: modes by toggling a bit somewhere (the number 623 comes to mind... hmmmm, or
: is it 559? - those are the shadow registers anyway, you'd need to modify the
: hardware equivalent to do it on the fly). Anyway the idea is that you can
: switch GTIA on and off by toggling a single bit. You can even do this in
: modes that do not directly support GTIA (like GR.0), they're not much use,
: but they look pretty. Ok, so the idea is to switch the GTIA bit on and off

On the contrary. Turning on GTIA while in text modes like gr.0 is very
useful and has been used by game programmers to save memory and provide a
faster character-based playfield for animation. This is called "IRG"
text modes I believe, where it is a bitmap mode using text as the
underlying data for the bitmaps, so you can only have 128 and their
inverse different objects which are filtered down into the various modes,
like for gr.9 with gr.0 underneath that means a 2x8 matrix, and gr.15 is
a 4x8 matrix.

I'd call these separate graphics modes myself because their memory
requirements are so vastly different from a real bitmapped mode.

It's misleading to only consider the graphics calls from Basic to be the
only modes you can generate on the Atari. These are some exceptions and
things like Antic3 (I think) text mode, you know, the one with the text
using the descenders, is another, etc...

CX85 support was something I asked of Clay long ago, I guess he put it on the back burner and has finally come round to considering it. God knows he's done everything else imaginable with Flickerterm :)

Re: CX85

I really think the Innovative Concepts hardwire modification was a hack that never got its due. I never got it done, IC vaporized by the time I tried to reach them, but it sounded so kool.

By the way, they also have keypads for laptops these days that plug into the parallel port. I bet that those are fairly easy to program and might be usable as well if someone was curious enough to try it out. Of course, there is no shortage of CX-85s, but the joystick port is not the most convenient of ports to tie up.

Eloquently stated.

This will work okay for Bob, but does not serve the community that well, about as well as it did for Oasis when Alfred let the software sit idle that way.

There is always Forem XEP.

I've always thought PRO! was getting ragged as far as some of its features which haven't changed since the Ledbetter days, like the primitive editor and its increasingly limited message base structure. I think it's about reached the end of its enhancement cycle the way Carina was with 2.5 and that any new BBS software for the Atari8 is best created from scratch in order to TRY to modernize it as much as possible.

I got some ruminations from Tom Hunt along those lines but we'll see.

From: aj445@cleveland.Freenet.Edu
Message-ID: <3jk5th$li8@usenet.INS.CWRU.Edu>
Source record: 93848

I have the following Atari 8 Bit items for sale to the highest offer. I would naturally prefer that the interested parties be within driving distance, so that they could actually SEE and operate any system that they are interested in (I'm in N.E. Ohio). However, I realize that that would be severely limiting the pool of prospective buyers. Be assured that all items are in perfect working order. All memory upgrades were done by myself, as well as any mods and normal maintenance.

Atari 600xl (64k)
Atari XEGS (128k)
Atari 800 (48k)
Atari 800 (188k)
Atari 1200xl (1 meg, SuperVideo 2.1 mod)
Percom SS/DD disk drive
Atari 810 disk drive (Happy Warp Drive enhanced)
ICD PR:Connection (new)
Atari 130xe (320k)
ICD MIO (1meg)
30meg SCSI HD (two 13.5meg partitions)
Basic XE cart.
2400 baud modem
Avatex 1200 baud modem
Commodore 1802 monitor (NOT perfect; occsionally needs to warm up)

I will personally check out any item prior to shipment. I'm a Sr. Electronic technician, and hold an Extra Class FCC Amateur Radio license. These items were well cared for. As mentioned, I'd prefer a local buyer, but I will ship to continental U.S. locales. If you are SERIOUSLY interested in any item, you may contact me at:

aj445@po.cwru.edu
cooncat@ix.netcom.com
kb8eb@wa8bxn.#neoh.oh.usa.na (packet radio)

Bill Somrak
(NOT leaving the Atari 8 bit community for good. I'll ALWAYS keep at least one system up and running, for old times sake!)

Hello! I am net here at the Internet and therefor I have some questions
about the Internet and this newsgroup:

1. About the Internet:
Are there any other sources, groups, servers etc. providing information
about the "good old" ATARI 8-Bit? I am interested in all kind of sources,
and please name mirrors, if possible (because I cannot reach every
server via every protocoll. My account is restricted to servers ending ".de"
and I can reach some general information servers for newsgroups, mail etc.)

2. About this newsgroup:
What is this newsgroup for? (Maybe also: what is a newsgroup?) Who moderates
it? What kind of text is supposed to post to it? e.g. Is it allowed to
put "to sell"-lists (private 2nd hand software, hardware) to this newsgroup?

--> Please post the answers to my E-mail-adress (below). I will collect
all mails and post a summary of them to this newsgroup. So please add
something like "I agree with posting this mail to the comp.sys.atari.8bit"
in your mail.

I will check my mail account at least once a week.

P.S.: What does the words "Summary:" and "Keyword:", automatically added
by rtin, mean?

I bought a Commodore 1702 monitor several years ago. It has both
composite video input as well as chroma and luma inputs. The monitor
has much better resolution than a color television. I found that the
chroma/luma inputs gave slightly sharper resolution than the composite
input. If you want to run a VT100 emulator in simulated 80 column mode,
a monitor is the only way to go. You should have no problem with a
130XE, but 800XL owners should be aware that a connection is missing
internally when trying a chroma/luma hookup.

>
[snip]

>The 1025 is built like the 800 - seemingly indestructible by anything short of
>a prolonged nuclear conflict. No graphics mode, only 7 pin text, with no
>descenders. Noisy and slow.

It's not *that* noisy. We have an Epson LX-810 at home; if you want to talk "noisy," visit my bedroom when we're printing on it. Compared to that thing, my 1025 and 1027 are positively quiet. (The 1027 is rarely used and currently residing in a box in my closet. Though its print quality is better than the 1025, it needs a new ink roller and is incompatible with some software, most notably the version of Atariwriter I'm using.)

Compared to modern ink jets and lasers, yes, it's very noisy. Compared to other dot-matrix printers I've heard over the years, it isn't that bad.

Oh, and one more thing about the 1025--it's *very* heavy. Though not very large, it must weigh 10-15 pounds (that's roughly 4-6 kg for you metric types). I picked it up as part of a system purchase last week, and I was very surprised when I took it out of the box. Who needs to pump iron when you've got a 1025 on your desk? :)

Re: #1: I dunno. Good question (because P:R: & 850 do <SIGH>)

Re: #2: You get up to 8 (or 9?) drive partitions at a time; each being up to 16MB (65536 sectors * 256 bytes per sector (Double Density)).
I think SpartaDOS allows for a real drive 9, but I could be wrong. MyDOS doesn't. It reserves drive 9 as a special case (RAMdisk). But if you had a large RAMdisk, you could have: 16MB/HDP * 8HDP's + 4MBRD - 64KSM = 135,104K or just under 132MB online! (Acroynms: MegaBytes, Hard Drive Partitions, RamDisk, SystemRAM, Kilobytes.)

Re: #3: I know the "old" Atari Classics had free ad's or something.. I don't know the "new" AC's policy. And yes, Current Notes is still around. Check the Vendors/Developers FAQ for a list!

Good luck!

Yes, P:R: can be daisy chained. The hardware itself is this:

One side of the box: SIO cable sticking out / SIO port
Other side of it: 9-pin R1: port / 9-pin R2: port / 25-pin P: port

I think it might be best to chain it at the beginning (and stick the 1050's,
etc. after it) because it draws power out of the computer.

Funny you should mention CD ROM. My son has mine intstalled in his computer more often then I have it, but it works exactly like a read only HD. Data rate isn't that bad either, about 250 Mbits second on a single speed if I recall correctly. So SIO2PC should work just fine with it, I'll test this if I ever get mine back. Now for the sad news: Were you aware there's a CD ROM available <if I read the blurb right> with every available program for the ST, JAG files, MODs, etcetera, *EXCEPT* the 8 bit files? Mildly irritating since I have both ST & 8 bit, but wouldn't spend $50 <25 UKPs> on my ST at this time, but would have if I could have gotten both ST & 8 bit stuff. Sheesh! A single MOD runs a couple of 100k's! They could have left one out & included 1/2 of everything worth D/Ling for the 8 bit. Guy who put it together probably wasn't aware we have 8bit=>SIO2PC=> CLONE=>CD ROM access.

OK got some questions here, folks.

First of all, someoen said sparta dos was in the archive.umich
FTP site. i looked in the Spartados dirctory, and i couldent seem to
figure out wich one was the actual sprat files. arent they in DCM format?
whats the filename for this?

Someone said atariwrite + was a very good 80 col word processor
for the atari 8bit. is this on any archive sites? if not, what vender
sells it, and how much?

lates!

2111. Almost-Free 800XL

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-09 01:52:50 UTC
From: steveg@phantom.com
Message-ID: <3jln1i$af3@dockmaster.phantom.com>
Source record: 93712

I have a beat-to-hell 800XL which still works, though I think one or two keys (I *think* the HELP key + one of the regular keys) don't work, and the power light doesn't work. It's up in my attic in New Jersey - and it might even be assembled. :-)

Anyone want this? Make an offer. Or a trade; if you've got a spare power supply for a 1040ST floating around, I'll gladly trade you for it. Dunno if there's a power supply or TV switchbox with it...come to think of it, I think there's a power supply but I'm almost sure there's no switchbox or TV cable.

2112. Dead 1050--any ideas?

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-09 03:23:21 UTC
From: ziggy29@rahul.net
Message-ID: <3jlsb9$efd@hustle.rahul.net>
Source record: 93838

I just picked up a 1050 which doesn't seem to work. When the drive is turned on, the power light goes on, and usually the "busy" light doesn't light up (and the drive doesn't spin). Occasionally, it does, but even when it does, it does nothing. I still get the READY prompt on the 800XL and the Memo Pad on the 800.

Something in the drive appears to be intermittently dead, and even when it isn't dead it isn't recognized by the computer itself.

Have any of you confronted a similar problem with the 1050? Any ideas about possible causes and/or cures?

Thanks!

From: kendrick@zippy.sonoma.edu
Message-ID: <3jlud4$vs@nic-nac.CSU.net>
Source record: 93840

What do you mean by joystick tester?

I usually just do this:

```
10 PRINT STICK(0),STRIG(0):GOTO 10
```

It should display 15 and 1 if nothing is being pressed.

If fire is pressed, the second number becomes 0.

Four directions (alone, not diagonal or other mixes) are:

LEFT=11 RIGHT=7 UP=14 DOWN=13

There's 32 possible combinations. All 16 stick combinations (4 bits) plus
the fire button (another bit).

: one-connect video output to a monitor or VCR? Is it worth getting a special
: monitor for, or is it just slightly better?
: Also, are there any monitors that have luma/chroma ins but are more affordable
: than the Commdore monitors?

Used C= monitors shouldn't cost you more than $75. I've got an 1802 if
you want to make me an offer on it. The RGB monitors like the 1080/1084,
those are more money naturally but the 1802 and 1702 can be had rather
cheaply.

It's worth it although you'll still have to switch to composite to view
artifacted colors, which many games use, like Loderunner for instance.

#==========James King, 3/4/95==========
#
#Funny that this thread should come up, as yesterday I came upon a 400
#that had been modified with a dual video/audio cable. It provided
#clear and sharper video than the standard plug that comes with the 400..
#
I don't know if all 400 were the same, but I did the whole 9 yards
with the one I have. I bought it when they were closing them
out so it was probably one of the last batches that were
made.

Anyway, I always thought that the video was pretty good, so
I left it alone. I added a 48K memory card and a real keeyboard
that has nice keys. I forget who makes it, but it was the better
of the two types available at the time.

I still have it and it still works.

The problem with ARC and other file formats is that they don't create
bootable disks. Did you give the "binary" command before you got the
file in FTP? What happens when you try to un-diskcomm it?

2132. CD high problem with my 14.4k baud

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-10 02:09:12 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1995Mar09.210425.21980@wariat.UUCP>
Source record: 93718

An anecdotal note on solving a problem with my modem. I was using an
unmentionable type computer and the term software kept acting like my
modem was connected all the time. It would not initialize properly
when loading the program. It kept saying 'disconnecting' when it
wasn't connected. It would go into 'Host' mode (a sort of mini BBS)
and keep going round and round like somebody was connected. The
solution was that my power plug had come partly undone and the
'non-volatile' memory of the modem had lost or changed the Carrier
Detect line status. CD was set at always 'high' or connected.
Took a at&c1&d2&q5n1w1 to correct the problem.
The moral of the story is that the new modems have A LOT of commands
and an non-volatile memory to keep certain settings. atz doesn't even
clear these settings on my modem at least.

Russ; I'll try to do this without ranting to much, but I don't think it's that we've been relegated to a small hole so much as lost in the crowd. For instance, I haven't seen a post lately, but some guy posted a blurb saying something like alt.sex.erotica.bin was the #1 group on the Internet with something like 250,000 people/week checking in. What do we have on the net? About 200 or so? We're probably less then 1 part per 1000 compared to the dirty picture folk. Ditto for graphic browsers like Netscape or Mosaic. They are nice, but transmiting VGA graphics to a PC even at 14k takes a lot of time/bandwidth, & those graphic browsers *seem* to be the weapon of choice for a lot of MS DOS or Mac users. I've sat there watched these beautiful 256 color VGA menu screens slowly appear & it no mystery to me why everything seems to be bogged down.

: available yet.

Is that 16 meg barrier a _total_ of 16 megs, or is that 16 megs per
partition? For example, I have two 20-MB SCSI drives. Does that mean I'm
beat if I want to access more than 16-MB, or can I set them up as (for
instance) four 10-MB partitions?

I'd be running SpartaDOS, btw.

2137. "Task Swapping Laws": tasklaws.txt (converted from HTML avail. on my page)

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-10 05:17:37 UTC
From: KENDRICK@sonoma.edu
Message-ID: <950309211507.2060258f@sonoma.edu>
Source record: 93726

I created the following text file which is available on my home page (I'm not releasing the URL to the public just yet).

It is regarding a task swapping environment. Now, whether it be the Macintosh, the Amiga, the PC, the Atari 8-bit, it doesn't matter.

Also, whether it uses linear RAM, banked RAM, virtual RAM, or a faked-virtual RAM (via file>S< on a disk or RAMdisk) this text doesn't care. You could be dumping the whole program's information (current settings, opened files, etc.) to a cassette when you jump from one program to the next for all this text cares, it all has to do with concept, not code.

I'll of course eventually add C and/or Action! pseudocode to my description, but for the moment, I'd just like to see what you 1000s of people think. (those on comp.sys.atari.8bit, those in the ADOS team, and associates/friends/ teachers of mine).

As it says at the very bottom.. questions, comments and suggestions are welcome.

Here I go... (PS- any word wrap problems are the editor's fault... VAX's.. can't live with 'em, can't 'net without 'em... or .. wait a minute!!!)

---------tasklaws.txt---------Lynx-capture-of-the-original-HTML:------------

TASK SWAPPING LAWS

These are the "laws" as I describe them to which a task-swapping GUI-style environment should obey.

These laws are based on the Macintosh System 7 environment and will hopefully be used in ADOS or K-OS for the Atari 8-bit platform (or Atari Sweet-16-based machines).

Terms:

The terms and acronyms used in the law descriptions are as follows:

* CLI: Command Line Interface
An environment where the user tells the interface to execute programs by giving it their name (and location) and the parameter list to send to the program.
Examples:
+ MS-DOS

+ Unix
+ SpartaDOS
* GUI: Graphical User Interface
An environment using bitmap- or text-based graphics, usually
using:
+ Windows
+ Icons
+ A pointer (usually mouse-driven)
+ Menu-bars
* OS: Operating System
A set of routines which are installed in hardware (ROM) or loaded
at boot-up (stored on disk and transferred to RAM).
* F-Man: File manager
A program which presents the user with some sort of access to
his/her files and applications. In a GUI, this would of course be
a windowed system.
Examples:
+ MS Windows 3.1 Program Manager
+ MS Windows 3.1 File Manager
+ Macintosh Finder
* E-Man: Environment manager (or "shell")
A program or OS routine(s) which bridges the space between the
user interface (CLI, GUI, etc.) and the programs.
The E-Man would place commands and parameters in a list and then
jump to or execute a program. The program would then act
accordingly.
Examples:
+ MS Windows 3.1 File Manager: File types (depending on thier
extender (.TXT, .GIF, .WAV, etc.)) would be associated to
certain programs (Text Editor, Graphic Viewer, Sound Player,
etc.). When the user tells File Manager to open a file, it
would launch the application and tell it to open that
specified file.
+ Finder: (Acts the same as Windows 3.1 File Manager except it
determines type and associated program as "resource" data and
is almost never determined by the user.)
+ Unix: Unix converts (variables, wild-carded file lists, etc.)
the command and parameters and executes it.

Opening an Application

In a GUI F-man or P-man, this would be double-clicking the
application.

This can also be performed from within other non-F-man applications. A
C-compiler might have other "external" programs it uses such as
editors, linkers, etc.

IF THE APPLICATION IS ALREADY "RUNNING"

Simply jump into it

IF THE APPLICATION ISN'T "RUNNING"
1. Load it into memory
2. Jump into it
3. Tell it to do its installation routine
4. And tell it to do its default load-up action (ask the user to open an existing file; create a new file; do nothing; etc.)

Opening a File(s)

In a GUI F-man, this would be either double-clicking the file(s) or "dropping" the files into the application.

Non F-man and P-man programs can also perform the task of loading other applications.

For example, a World Wide Web browser can jump into a text processor to view HTML source files or into an MPEG player to play MPEG animations.

IF THE FILE'S APPLICATION IS UNKNOWN (N/A IF "DROP" IS PERFORMED)

Report an error or prompt the user for an application to process the file with

IF THE FILE'S APPLICATION IS LOADED OR NOT LOADED
1. Load or jump to the application
2. Tell the application to open the file(s)

Special Case: Direct Returning from an Application

A good F-man should be able to process multiple files at once. For example, the user can select a half dozen text files, double click the whole lot, and the associated application (hopefully a text editor) would load up all of the files.

Another example is say 3 text files and 3 graphics files are selected and then "opened" (double clicked). The F-man would load the text editor, tell it to load the text files and also tell it to return to the F-man (or E-man, assuming the F-man would be piping a batch of commands to the E-man; E-man is useful for smaller machines because the F-man would be a large, complex program, and the E-man would simply be the actual program launching routines, without the user interface). Once the F-man has been reloaded or jumped back into, it would then load the graphic viewer, tell it to load the graphics files, and either stay in the graphic viewer, or return to the F-man or E-man and it would choose which application to load.

EXIT (OR RETURN)

Along with other basic commands such as launch, do nothing, and open files, this would be another option which would return to the previous system level (E-man or F-man (see above)).

Special Case: Auto-quitting an Application

A good F-man should also support a "shut down" feature for quickly exiting from all applications (properly) and quitting the F-man (either back to the lower level environment (DOS for example) or allowing for powering down).

It's also useful for the F-man to be able to see what programs are idle (without open windows or files) and let you quit them when you try to open a new application but are lacking the memory to do so.

QUIT

The program will simply act as if you selected it's own "Quit" command; prompting you to save open files (if any), if you're sure you want to quit, and closing up support files (preferences, data files, etc.).

2139. Clock speed-up

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-10 06:20:10 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <134522@cup.portal.com>
Source record: 93731
Body handling: HTML body converted to readable text

This is really, to whom it may concern. I had one of those insights about a clock speed up so I wire wrapped it today. I was thinking the reason why my video did not stabilize last time I put a 4 mHz crystal in my computer it was because the horizontal sync pulses were to short with the faster crystal sooo...
Bent out pin 25 of GTIA, csync, & ran it through this kludge:
74LS04 20k VR 120 for safety
\/\/\/\--/\/\/\/-----5V
:\ 1n914 : :\
csync----: >o -:<--:--: >o---new csync
:/ diode : :/
___
___ .1 micro Farad disk cap
:
Ground
This thing was so sensitive to the timing, you just look at the pot & the display skews even with a 3.59 mHz crystal. Punch line is I got it to work with both a 3.68 & 4.0 mHz crystals, but the results weren't as good as I expected. You loose ALL COLOR, only thing you get is luminescence. I was hoping at the higher clock rates you could at least get a wide playfield 48 column mode . On my monitor, I could only get 46 characters on screen at once, & on the right hand side there was some snow displayed as a vertical band. On the left hand side it lost the first 2 characters off the edge of the screen. Looks like I'd need something a little more sophisticated if I want a 48 column mode. Understand, I could probably just send everything through a shift register to delay/move the display over or maybe even do some fine tuning inside my monitor. I think they make a 4.19 mHz crystal, but now that I got the 4 mHz thing a done deal I think I'm gone. Wasn't really a fun project, but at least it's easy. I didn't check the SIO timing either. It's not that hard to shift clock sources so if you wanted to do something like an interleaved 80 column display with a faster refresh rate & switch back to 3.59 mHz for disk access, you could even do it with a toggle switch. There are reasons why you may want something like a 3.6864 mHz crystal, for instance, you could exactly duplicate sio 115,200 baud since this is the same basic time source for most RS232 type UARTs, but that doesn't interest me. Other fish to fry right now. Rick

> Hmmmm... What then was the 65xep I read about in the FAQ?

Yeah...that's what I thought. Remember reading about the 65XEm with the "Amie" sound chip? Anybody know where did the design for that chip come from? Was it an Atari in-house design? Was there a Pokey in the XEm design (with the standard capabilities and I/O) and an additional sound chip (Amie) added (hooked in where?), or was the Pokey somehow replaced??? Did the Amie ever get to the stage of being in an actual chip? I've heard that it never even got that far. When all this talk of the XEm was in the works, and the ST was soon to be released.....when I saw taht the XEm was cancelled and the ST had a cheesy 3-voice mono chip, I reckoned that the Amie probably wasn't even close to being the real thing.

> Question: Don't some of these "vaporware" peripheals exist somewhere? I
> would be interested in hearing about the performance of the 3.5" drive, the
> color monitor, etc.

Heh. I remember starting at the back of the 130XE box (when I bought my first 130XE new in the store) at the "XE style" monitor and disk drive. I kept after my local Atari dealer, asking when those products were available. Before the XF551 came out, he told me that they had (or there was talk of) a "1050CR" - which was (not DS/DD) just a "recased" 1050 drive. I don't know where he got his information....could be lies. However, if memory serves (been a long time since I've seen a 130XE box), the drive didn't look like the later XF551.

At one computer fair I actually got to see (courtsey of
> SLCC) a 1450xld, an 815 drive and other rarities. It was pretty cool.

How I'd love to find one of these under the Christmas tree. Both good ideas that would have sold, I think. Perhaps the 815 was too ahead of its time, since it was so expensive for one drive...let alone TWO back then. However, wasn't the 815 double density? If so, they would have done some justice to make the 810 DD, despite cost. Of course, they screwed up the 1050 and left ICD to fix it. Every time they set the lowest common denominator, they sure limit things. Look at what Tramiel did with using single-sided 3.5" drives on the ST. Wasn't long before they switched to DS, but software houses were forced (still???) to put out 2 SS disks for years..... :(

James

All things considered when it comes to PRO, I feel that it is a well thought out program, even with it's limitations.

I feel that the programmer did _VERY_ well in limiting the size of the message areas. I mean after all, we're talking about an Atari 8-bit system that this software runs on. This gives users with limitwed resources and drive space the chance to still run a bbs without having to have gigs of hard drive space just to set up message areas, let alone having enough space to run the bbs itself.

I know that I appreciate the fact that the message bases and sizes of the messages is limited, and leaves me more room for file areas, and "extras" that I may not otherwise have due to runaway message bases.

I've been a SysOp using PRO since Keith Ledbetter put the program on the market. I've seen many inprovements made to the program, including increased speed. I also know for a fact (since I'm a beta tester for new versions of the program), that there are many hours spent "tweeking" PRO to get it to be the best program that it can be.

Those who have ideas on improvements should submit them. This is how alot of the ideas that have been incorporated into PRO were put there, because of requests by users.

I also feel that anyone who is left that takes the time to program for the Atari should be supported, rather than condemed to failure. Recognize!!! There are not many left. Let's keep the ones we have.

>I've always dreampt of a BBS on the Atari where the user had a psuedo (or
>true!) account; their own directory and disk space.

This had always been my biggest gripe about BBS's! (What is the plural of BBS anyway?) I started my telecommunication career my freshman year at college with my 800XL and 301XM (?) modem connecting up to the IBM mainframe. Soon after that I got a VMS account on our VAX, and never looked back.

After I graduated I missed that online feeling, so I checked out a couple of local BBS's. All menus, no command lines, no disk space I could call my own. And the worst thing I've seen on BBS's is the actual bulletin board itself. Half the time I can't tell if I'm sending a private message to someone, or if everyone who reads the board is going to see it. I would like to see a BBS that separated the e-mail from the BB.

Well, my BBS'ing days are over. I got Warped, so I get my news and mail, and read and reply offline. Anything I want to download I FTP.

Later....

Hi,
From AEO...

For more advanced features, Demon Internet Software might be for you. The developer, Demon Internet located in London, provides a software kit that consists of TCP/IP software KA9Q, email software, Usenet readers, finger, Telnet, and FTP programs. This software is available in the US on major information services and on the Internet. There is not, as yet, a graphical Web browser for the Atari ST. However, the text based LYNX will work fine. ...unquote.

Hope this helps.

By the way, an address was given for Demon Internet... internet@demon.com (email).

The article was written by Ron Whittam... explorer.4@genie.geis.com on the Internet, EXPLORER.4 on GEnie, or on ApC BBS (208-362-1790).

2153. 1030 modem problems...possibly...

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-10 18:03:29 UTC
From: ziggy29@rahul.net
Message-ID: <3jq49h$mqb@butch.lmsc.lockheed.com>
Source record: 93747

I think I'm having a problem with a 1030 which worked when I last used it about 8 years ago. Maybe it's the power supply; I don't know. Here's the deal:

I couldn't find the PS for the 1030, so I used the "closest" thing I could find. In this case, it was the standard 2600 power adaptor.

The 1030, according to the FAQ, needs 600mA; the 2600 supply provides only 500 mA. The 2600 PS manages to properly "light up" the "ON" and "READY" lights. When I tried to use a copy of 1030 Express! which I just obtained, the software says "Turn on modem and reboot."

My question is: Could this be due to the fact that the power supply isn't "full strength" and therefore not allowing the modem to operate at all (appearing to 1030 Express! as a turned off or dead modem)? Or is it likely that the modem itself is dead? I'd like to know before I shell out the bucks for another power supply which exactly matches the specifications.

[Before you ask why I'd want to operate at 300 bps, I don't...at least not for long. What I'd like to do is just get started until I can put a 9600 bps setup together. I'd also like to download some other comm software so I can use that when I do upgrade.]

2154. MIO Problem/Question

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-10 18:11:04 UTC
From: rob@wc.cdrom.com
Message-ID: <3jq4no$g8s@reason.cdrom.com>
Source record: 93751

I'm still having trouble with my MIO, and I think I know what the problem is. When I bought it about six months ago, the power supply (an Atari unit) had a note on it saying to use ONLY that supply with the MIO. I'm guessing it's more capable than other bricks.

Now I don't know which brick it's supposed to be. The ones I've found now (I'm unpacking after a move) are all the same and don't work (the MIO does some very weird things). I was hoping somebody knew which power supply I should use... e.g. model number or something. Or if nothing else, the specs I need to make it work right so I can get a new supply entirely.

Thanks!

Rob

> very useful and has been used by game programmers to save memory
> and provide a faster character-based playfield for animation.

I've never seen a game that used character-based GTIA for animation.
Maybe a couple of title screens, but no actual game action. Example,
please?

> This is called "IRG" text modes I believe, where it is a bitmap

"IRG" is an Inter-Record Gap... that pause you hear between data
being read or written from a casette tape.

You're thinking of the "IR" modes. Actually, *every* ANTIC mode is
an IR mode. It stands for Instruction Register, I belive. People
referred to the multicolored text modes as the IR modes back before
Atari Basic directly supported them.

> I'd call these separate graphics modes myself because their memory
> requirements are so vastly different from a real bitmapped mode.

Well, uh, the 4x8 multicolored text mode IS a separate graphics mode.

I always walk into a thrift store and see a whole bunch of Atari
joysticks in a box, at low prices, but you never know which works!!

A cartridge tester would be great - but for an original 400 or 800
machine. You could pop in the cartridge, plug in the computer, and have
audible feedback through beeping the internal speaker. You wouldn't have
to hook up to a TV, and you could test joysticks anywhere with a little 400!

No it isn't. AtariWriter 80 supports the XEP-80 for 80-columns
of text.

"+" added a spell checker, mail merge, and supports extra RAM
on a 130XE.

Was there ever a 80-column WP for a stock 8-bit? Maybe a text
editor ala FlickerTerm could be made?

There's a place locally which always has a huge box full of them
for three bucks each. In general, I've found that if you don't
hear rattling when you shake it, it either works or is easily made
to work with proper cleaning of the parts inside.

>A cartridge tester would be great - but for an original 400 or 800

Heh. That would be a good use for my worthless 400 which has a weird quirk
with the keyboard. It seems to do very well as a cart-playing machine,
but that's about it.

What would be cool would be a portable device like an ohmmeter or a voltmeter,
with the familiar 9-pin port on the side of it. When you press a button,
something would light up. If you move the joystick, a "needle" moves in the
direction of the stick movement.

If it were small enough to fit in your pocket, you could take it with you
any time you needed a few replacements.

From: kendrick@zippy.sonoma.edu
Message-ID: <3jql11$eg8@nic-nac.CSU.net>
Source record: 93748

Here's what you do! You want a hardware joystick tester.

Ok, get one of those joystick extension cables and sacrifice it.
(THe ones you can get at Radio Shmuck which have a standard stick plug
on one end (goes to the computer) and the male opposite on the other
(looks like the computers' jack)).

Slice off the part that goes into the computer, so that the other end is
there for you to plug the testee into.

Wire up a battery and some LEDs or lamps to the thing, hooking them up to
the proper wires on the inside of the cable, and you should have a good
stick tester. Completely portable! Battery operated! Not has heavy as
a 400! :)

It'd be like this:

The "ground" pin would go to one of the battery sides (neg or pos)
The other end of the battery (pos or neg) would go to the lamp (or, more
likely, lampS)
The remaining 5 pins (up/down/left/right/fire) would go to the lamps

That way, when you move the joystick, the side of the battery going into the
ground would pass through to that direction's pin and go into the lamp,
thus giving the lamp BOTH sides of the battery and lighting it up.

Now, on a side note, Radio Lameasses just game out with a "new" controller;
a sega-style one which I'd like to use on my Atari, but, even though it's "new"
they've already supposedly DISCONTINUED IT!!! >:^(And it was only >> $15 <<!

So.. does anyone know where to get a Sega Masters or Genesis controller for
pretty cheap!?

Thanx!

Get about 5 or 6 LEDs, put one on pin 1,2,3,4, and I believe 6 is the button.

But LED's are the cheapest and easiest way to build a test, and get as close
to 5V as possible. Maybe a 9V with a 5V zener diode would be the easiest
and cheapest way. You could arrange the LEDs on an experimenter's box in
the proper arrangement and stick the battery in there, put it to the +5V
supply line on the joystick and connect ground and you should have a working
joystick tester. I have never built one, so this is just theory.

NOTE: This letter got mailed to me by mistake. Evidently the poster
didn't understand how to read NewsGroup message headers and assumed that
my reply was an origin message. Due to the importance of the message to
this USENET NewsGroup, I am including it below. By the way, what is a
Z-MARGIN ? I wasn't aware of such a feature on the earlier TEXTPRO
versions 4.xx that I had been using.... What does this new feature do?
(I was aware of the Assembly Language ADD-INs and the lightning fast
search-and-replace string features....)

NOTE: Also, while I am on the subject of TextPro, does anyone know how to
do "three element" headers ? I tried going:

CHAPTER 1[c]ATARI MANUAL[e]Page 1

...in the hopes of getting:

```
l...+....1....+....2....+....3....+....4....+....5....+....6....+....7
CHAPTER 1 ATARI MANUAL Page 1
```

...but it doesn't work. I wound up going:

```
CHAPTER 1
[c]ATARI MANUAL
[e]Page 1
```

...and then cutting and pasting. <* sigh! *>

```

Hi Winston,

Saw your message requesting information about using an Atari 1020 printer with TextPro. I've used both and it's not too hard to set up TextPro to invoke the 1020's various features. Hope it's not too late to offer some assistance.

Although you asked about how to set TextPro's margins to 40 columns, the printer can be set to print 20, 40, or 80 columns in international or standard characters. The defaults when the printer is first turned on are 40 columns and standard characters.

TEXTPRO FORMATTING COMMANDS

Margins (and other TextPro features) are set by text formatting commands. With TextPro, these are usually placed at the top of the document and are entered by holding the [SELECT] key while typing a _lower case_ letter. On the screen, the letter should appear in inverse video. Below is a list of the most important text formatting commands and their defaults:

```
[SELECT] + Key Default
-------------- -------

b bottom margin.................58
c center text..................none
d down page with count........none
e edge right...................none
f footer define................none
g go to linked file............none
h header define................none
i information line.............none
k down page w/o count.........none
l left margin...................5
m margin release...............none
n next page, conditional with #0
p page length..................66
q justify right 0=off 1=on.....off
r right margin..................75
t top margin....................5
w page wait.....................off
x columns across...............80
y set z-margin.................none
z z-margin.....................5
# page number..................none
@ starting page number.........1
? print starting with #........1
& stop at page.................none
! skip # pages during print....0
```

To set the margin to 40 columns, enter these lines at the top of your document:

[SELECT-l]0[RETURN]
[SELECT-r]40[RETURN]
[SELECT-x]40[RETURN]

Hold the [SELECT] key while typing the letter and release it while typing the number. All of these commands can be typed on the same line with only one [RETURN] at the end if you want. The numbers associated with the "l" and "r" set the actual margin widths. The "x" number sets maximum page width (the printer's column width) and is used during line centering.

TEXTPRO PRINTKEYS

TextPro doesn't use printer drivers as some word processors do. It's possible to send commands to your printer at printout time by imbedding them in your text file. The method used in TextPro is to assign a printkey that represents each printer feature. Each printkey uses an _upper case_ letter typed while holding the [SELECT] key. On-screen in your document, the letter will appear in inverse video.

Most printers have a command set made up of "escape sequences". During printout, the ASCII escape character is sent to the printer followed by the command character. The escape character can be included in your text file by pressing the [Esc] key twice. A special escape symbol should be displayed on the screen at the cursor location on the second press. The command character will be the assigned printkey and will also be included in the text.

To assign printkeys for the Atari 1020 printer, boot up TextPro and type in the following printkey assignments:

[SELECT-N]=14[RETURN]
[SELECT-P]=16[RETURN]
[SELECT-S]=19[RETURN]
[SELECT-W]=23[RETURN]
[SELECT-X]=24[RETURN]

Hold the [SELECT] key while typing the letter, and release it for the equals sign and number. These five lines should be placed at the top of your document either above or below any formatting commands. They will define your printkeys. They may be written to a file by themselves which you would load before typing in your text if you don't want to have to type them in each time.

To use a printkey to invoke a printer feature, type the [Esc] key twice and hold the [SELECT] key while typing the upper case printkey letter. The escape symbol and inverse printkey letter should be positioned just before where the printer feature you want to use begins. Here is how to type the printkeys into your text and what they mean:

printer Feature Escape Sequence
-------------- ---------------

20 Columns........[Esc][Esc][SELECT]P
40 Columns........[Esc][Esc][SELECT]N
80 Columns........[Esc][Esc][SELECT]S
Start Intnl Char..[Esc][Esc][SELECT]W
Stop Intnl Char...[Esc][Esc][SELECT]X

When setting printer column width with printkeys, keep in mind you will also have to set TextPro margins and columns across to prevent words from being broken at the ends of printed lines.

International characters can be printed on paper, but will show up on-screen as a different symbol. To print international characters on paper, turn on the feature with the printkey. Type the [Esc] character _once_, then hold the [CONTROL] key and type a letter key where you want the international character to appear. At printout time, the international character associated with that letter key will be printed on paper. You can use TextPro to make a chart that you can print out and keep that will show all international characters. Type the international printkey first, then make a list like this:

A [Esc][CONTROL-A][RETURN]
B [Esc][CONTROL-B][RETURN]
C [Esc][CONTROL-C][RETURN]
...
...
...
Z [Esc][CONTROL-Z][RETURN]

Hope this helps you to better use your Atari 1020 with TextPro.

Steve Wallace

No problem with a couple of 20 meggers. That 16 megs max per partion. I'm running 85 megs and have no problem accessing anything.

There are also utilities that allow a user to break the 120 meg limit, but I don't know if there are any that are stand alone.

On you MIO power supply problem:

You didn'T say which MIO you have, so I'll go through both of them, and I'm sure if I miss anything, someone else will step in and assist.

Version 1 of the MIO (the one with the video port) uses a 9V AC power supply Mine is rated at 9V AC 31VA.

Version 2 of the MIO (the one WITHOUT the video port uses a 9V _DC_ power supply. My power supply for this unit went south a LONG time ago, so at this point, I'm using a different Atari Brick power supply rated at 11.5V DC 1.95A

Hope this helps.

Tim; 90% of the time when this happens it means the 12V power supply is going south. Diodes CR15 & CR16 get so hot they desolder themselves. Atari's fix was to just solder the diodes about 1/2" off the board by leaving the leads real long. Just resolder the diodes & if that doesn't work it may be something like the 6532, this controls the motor on/off. Other stuff does go bad, like the controller itself, but IMHO: Not that often.
Rick

Clay, I don't know if you wanted an example of GTIA mode or character based animation or neither of the above<g> but Dungeon Lords by Brian Bradly ~ANALOG 67-72??? used character set based enemies for just about all the movement. I think the only P/M thing on the screen was the 'hero. He used about 4 incarnations of a 2x2 graphics 12 to simulate movement for maybe 8 different opponents. I'd have to boot the game up again to see, but I think he didn't set the 7th bit of the characters matrix to get the 5th color during the game. I'm sure you know you can set GPRIOR to a GTIA mode while in a character graphics mode, but I've never done a conversion program to go from graphics 9 to a graphics 0 character set for instance. It would seem like a worth while project for something like a Dungeon Master clone. Rick

You know what, though. I have a 486dx2/66 with SuperVideo (64bit video),
and Mosaic and/or Netscape were only mildly interesting for about 2 weeks.

After that, I switched back to my Atari in standard command line/ shell
mode. I hardly even use my graphical (Windows) stuff anymore, and resort
to dialing out with a plain term. program to check mail/news.

Web surfing gets boring REAL quick, then its back to basics again.

I hardly even use my PC anymore - as its quick to just boot up the
XE, load BObterm with my XEP80 and hit the net.

>
>
> BTW I'm looking for the greatest game of all: StarQuake hope someone
>has it!.
>
> Enrique Velasco
> evelasco@dcc.uchile.cl

Well, The copy protection for these and most of the Lucas Games is
it has a boot up timer...that is to say it should boot up in a certain
amount of time ONLY. If it boots up faster or slower than this
the game believes it to be a pirated copy of the game.
If you have a US doubler or 1050 Duplicator you know that in order
to run any of Lucas Games games, You have to turn the speed off on
Your drive or else it will load up faster than it should and
the game will believe it to be a pirated copy
Hope this helps, as to a solution, Your on yur own Im afraid.
One thing you may try, If you OWN the game, Is to put a patch
on the game so It won't do the timed Boot-up check and
then it won't note that it is a pirated copy or not. BUT
you may ONLY put a crack patch on a game if YOU own it, Otherwise
It would be ILLEGAL!!!
Comments are welcome.....

2182. Old games becoming rare?

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-11 23:31:15 UTC
From: toastman@armory.com
Message-ID: <3jtbs3$3cu@nic.scruz.net>
Source record: 93622

It seems that the only place I can find games for the Atari 8-bit is the umich site... but it only has about 30 files in its directory. I remember logging onto boards in the 80's and finding hundreds of games available for download.

I've tried getting a few things from the Cislib directories but it's a total mess. All the files are .xmo or .bin files, which are completely inconclusive, and if it was easy to wade through all that, someone would have typed an index file by now. BTW, I use an Xm301 to download them to the atari, from my 386SX-16, this rules out trying them ALL on the atari, or trying them on an emulator. I did find out that a few of these .xmo and .bin files began with 0xFF,0x80...what are these? (comoki.bas was cool though)

Is there an FTP site with the massive collections of mid-80's games I'm used to seeing? Good stuff out of Analog, or such things? Things like that Snowball Fight (unparalelled!) or clever BASIC concoctions like Biker Dave, or that rare one I came in looking for called Hard-Hat Willy (NOT MACK!) that one person responded to, but never got back to me on, even after I checked back in six months later after finding his address in a 60-byte file called "fone" ion my source code directory. There was a BASIC game that ran in Gr11 called Colortype, I used to practice my touch typing with it, and I modified it to work with SAM, too.

Would it be in anyone's best interests to start one again? I'd offer a trade, but virtually all I have is from the archives. I'd be wiolling to give my mailing address to anyone who wants to sell disks, and if you want to trade that way I can just send you a copy of someone else's disk. :)

Thanks in advance.

If you want to ftp to umich, try this address:

barnone.citi.umich.edu (141.211.128.22)
/afs/umich.edu/group/itd/archive/atari/8bit

It should let you in fine. I don't have ftp access at the moment to try it,
but I have used it before (like about a month ago), and it always seems fine.

Try it and see.

Richard =8-]

PS. Thanks to whoever it was that posted this address ages ago.

(Somebody, (gees, short term memory), says the early MIOs with the
video port uses a 9v ac pwr supply and the later ones without the
video port use 9v DC pwr.)
I'm posting this here because I checked the FAQ and it has the info
I sent M. Current which is:
1 meg MIO uses a 9.3v DC power supply. (It happens to be an old one
with the video port.)
256k MIO uses a standard 9v ac CO17945 brick. (This is one without
the video port.)
I'm getting confused and if M. Hohman reads about this I'm sure he
could clear it up.

I have to say, having just gotten my copy of Express! Pro multiline from KPI, that I7m very impressed with the program though I find it interesting that it still very similar to the original BBS Express!. My fist thought was like several others, "only 32 message bases?" but then, how many bases do I really read when I call the RepairShop BBS anyway...3 maybe 4. The general stats on two of the local MSDos boards don't really look much better...i.e. lots of bases, very few readers...

The only one that comes to mind is the one sold by CSS, "The Richman's Word Processor". It sells for something like $39 though that may have chanced by now.

(From the CSS ad)

This 80 column software-only word processor features ease of use and all features needed in a word processor. Works best with a black & white TV or monochrome monitor. Its features include:

Completely menu driven - Insert and Delete - Self containded DOS
Search mode - Complete text formatting - View-only mode
Built-in printer drivers - Memory statistics - Page numbering
Alternate output - Justify and endfill - 80 columns on screen
High speed cursor - Mouse compatible - Spell checker - XEP-80 compatible
Change screen colors, borders, and luminance.

Long ago (circa 1982) I saw in the pages of Antic & Analog an
advertisement for an arcade game called something like "Jupiter Mission".
Apparently it came on several disks, and looked like fun. I believe the
publisher was Avalon-Hill. Anybody have info or play the game? This
just popped into my head & I'd like to know.

I bought it in 1987. Parts written in BASIC, 4 disks. Difficult. I
didn't get past the 3rd part (navigation). Kinda frustrating. There
were sealed envelopes with hints for each disk, not very helpful IMO.

There was a sequel "Quest of the Space Beagle".

2192. 800XE!

>I'd be interested to find out as much as I could about the 800xE, since
>I know very little about it, and there hasn't been much about it here either.
>All I know is that it was intended for Eastern Europe...

The 800XE is actually an 800XL with the130XE's Freddy (memory managment) chip built in. It's case is the same as the 800XL's and it looks the same indeed it had the Parallel port of the 800XL (not the ECI of the XE). However Freddy's there. The 800XE by default still only has 64Kb of memory although since Freddy is capable of handling more it's common to find 256Kb of memory in these machines.

Now this is where the crunch comes, I'm not sure weather or not the 800XE is actually issued by Atari as an 800XE as one of the last revisions of the 800XL before the 130XE, OR, weather some of them hardware people in Germany, installed the chip into an XL, or even redesigned the board for the Freddy chip!

What ever the reason, why it seems as though it was intended for Eastern Europe is some German hardware freaks decided since the motherboard was a cross between an XE and and 800XL to call it the 800XE.

I just know based on history that commercial BBS systems that suffer the indifference of their owners tend to rot away rather than get further development from 3rd parties because the owners tend to stifle development by not offering original source code which would be necessary to make important changes from the ground up.

In this respect, openly free systems like Forem XEP have much more potential for improvement.

No amount of 3rd party modules will solve some of PRO!s internal inadequacies which may be solvable if the owners just gave the thing up to PD and released the code.

I'm at a loss right now and really could use some help.
I bought a 1050 disk drive and an 800 at a swap meet the
other day. Unfortuanately when I got home, I found that
the drive did not come with the dos disk (Dos 3 should
have been in there with the books for it). Does anyone
have any ideas as to what I could do. I have found
copies of some dos's for ataris in SIO2PC format and
XF25 format. Would it be possible to write these to
a disk on the PC that I could then boot from??

Any help would be greatly appreciated. Thanks

Jay

I've added two new mirror sites to the FAQ over the last couple months,
in case people haven't looked at that section recently.

It's true that both umich itself and wuarchive are usually full, but that
still leaves about six regularly updated mirror sites I rarely have
trouble with.

>better...i.e. lots of bases, very few readers...

As an experienced MS-DOs sysop, I can attest to the fact that
32 message bases is PLENTY for a single-line, hobby board. there's
plenty of room for a variety of subs with that many bases.
And, as you said, most callers don't even bother to read them.
There's a HUGE file transfer segment of the BBS user population, and
a large online games segment. The pool of people who read and post
messages is, sadly, relatively small. :(

Russ Gilbert (Russ.Gilbert@apk.wariat.org) wrote:
: (Somebody, (gees, short term memory), says the early MIOs with the
: video port uses a 9v ac pwr supply and the later ones without the
: video port use 9v DC pwr.)
: I'm posting this here because I checked the FAQ and it has the info
: I sent M. Current which is:
: 1 meg MIO uses a 9.3v DC power supply. (It happens to be an old one
: with the video port.)
: 256k MIO uses a standard 9v ac CO17945 brick. (This is one without
: the video port.)
: I'm getting confused and if M. Hohman reads about this I'm sure he
: could clear it up.

Odd, I have run both 1meg and 256k MIO's off the same brick for some
time. (Both are old ones with VIDEO ports... however, the 256k is
even older since it has pin headers for the 80 column card and power..etc..)
The only physical difference between my 2 mios is the EPROM and the RAM
count. In fact, I pulled my EPROM from the 256 K and threw it and its mem
chips into the 1meger since the 1 meger killed itself when my switching
power supply shorted a few years ago.

By the way... the ZIP rams in the MIO..use special ram chips...
Internally pins 1 and 5 are switched (as I recall).
they were made special for ICD supposedly yet used the same numbers
and the non-switched chips?

odd...

2209. European 600XL question..

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-13 03:56:30 UTC
From: heller@akh104.rh.psu.edu
Message-ID: <3k0fpe$11bc@hearst.cac.psu.edu>
Source record: 93648

I was wondering how difficult it would be to convert one of these
to NTSC. 'Cause I want to get a 600XL with video ports and RF
FACTORY installed. (I am in the middle of upgrading my 600XL
to Supervideo2.1 but I would like to have an OFFICIAL released one with
video installed.)

That an an 800XE would be cool too.

By the way, someone a while back was wondering why the serial numbers
on the some 800XL's just said "800" and others said "800XL"...
well, I was surfing through tons of old news letters from 80 to 87
and came accross some "rumors" about the new line of computers
after the 1200XL. Supposedly there was going to be a "NEW" version
of the 800, with 1 cart slot and 2 joystick ports, and only 48K.
They weren't going to change the name or anything supposedly....

So I am guessing that is what the 800XL became.

whatever...

by the way... did you know you can use RGB monitors on the 800? =)

There are index files from CIS on there: lc1.arc, lc2.arc, lc3.arc,
and lc4.txt... covers most files.

>I did find out that a few of these .xmo and .bin files began with 0xFF,
>0x80...what are these? (comoki.bas was cool though)

XMO and BIN just meant an 8 bit protocol was need for transferring
those files. If it starts out $FF FF it's usually a binary load
file. $00 00 signifies a SAVEd BASIC file.

2214. Strange "power losing" modem?

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-13 04:45:45 UTC
From: ziggy29@rahul.net
Message-ID: <3k0ilp$2d3@hustle.rahul.net>
Source record: 93652
Cross-posted to: comp.sys.atari.8bit,sci.electronics

I've got an interesting thing happening with an Atari 1030 modem. It seems to "lose power" after starting up. At least the computer it's connected to seems to think it's lost power.

There's a built-in terminal program to this old modem, which apparently the modem sends (via ROM?) to the computer. Anyway, for this to happen, I assume that the modem must be receiving power. Yet when the terminal program actually *starts*, the message "modem power lost" is displayed, despite the fact that the power on light (and the ready light) still shines brightly.

I think the modem "starts" as being okay, but somehow becomes unrecognized by the computer. I'd think the power supply must be okay, but how does electronic equipment just "start up" seemingly normally when communicating with the computer, and then suddenly become unresponsive due to "lost power?"

I'm basically an electronics dummy; pointers and possible causes and/or solutions would be appreciated. Someone has suggested that there could be a problem in the I/O cable, but swapping cables preserves this problem.

I may decide it'd be cool to rewrite Cooltris 2 on the PC and/or Mac
platform for those who care! :)

On PC it'd most likely be in QBASIC in 320x200x256 graphics w/ PC speaker
sound.

On the Mac it'd probably be in C with 256 color graphics and digitized
audio.

Of course, in either version I'll have a full blurb about the 8-bit
version, where to get it, the fact that us 8-bitters are still
around, etc.

Some people don't know, ya know! :)

It was released. It differs from the 2600 in that it is fixed in
controlled-missile mode, and has new enemies, balloons, tanks, and
apache-like machinegun helicopters. Yet the executable is still only
about 8K.

I believe you can start at various bridgenumbers, in increments of 10.

Huh? Sometimes you're scarey, Amos. You think that limiting the base size is a GOOD thing? I've been running Express (then Pro!) since Ledbetter created it -- and was running a homebrew BBS just after Xmodem was created.

Pro! leaves quite a bit to be desired - and the assanine behavior of its programmers is beyond comprehension. Not providing any source code has contributed more to the downfall of Pro! than any other factor. During the Ledbetter days, it was encouraged to provide source, so others could create modules.

>because 1200 baud is actually in the tolerable range for speed.

But I already have the 1030 and 1030 Express! to use...if I can get it
to work. I don't want to spend good money on anything under 2400 bps,
actually...I just want to download software which can support a 9600
connection and then junk it. THEN, I can get the 850/P:R:/MIO/BB and
9600 bps modem and let 'er rip. (I already have an 850 modem cable,
too.)

I figured I could connect with the 1030 (at 300 bps) and start down-
loading the necessary files before I go to work in the morning, and
it *should* be done by the time I got home. :)

2226. What is GTRACKER?

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-13 18:30:53 UTC
From: CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK
Message-ID: <2D658AB4332@east-01.novell.leeds.ac.uk>
Source record: 93567

GTRACKER is a new piece of commercial software from Visionaire
Software in the UK and sold by Richard Gore.

It can best be described as a sequencer for digitised sounds. You
sample some music (or whatever) using Replay, Parrot, ASP etc and
use GTRACKER to arrange and sequence it into a longer piece of
'music'. The editor is low level and requires the user to keep track
of the start and end addresses etc but it is powerful and supports
Gumby compatible stereo upgraded machines. Your mono samples can be
played back through both channels at once and/or steered to only one
of the channels (left or right). the tunes can then be saved and
played using the player program supplied.
GTRACKER is a two disk pack, one of them is a PD demo disk to show
you what can be done with GTRACKER. The package retails for #6.50
($14). We also have nearly ready a suite of utility programs that
include a sample editor and a mini compiled language to allow
inclusion of the sounds in your own programs, more utilities and
demo sound disks will follow.

Recently I uploaded a copy of the demo disk to the archives under the
name GTRACKxy.DCM, x=1 or 2, y= A to E, unfortunately side 2 got
corrupted and needs some extra files uploading which I will do shortly
In the meantime please download side 1 GTRACK1y.DCM and enjoy it.

If you want more information about GTRACKER please feel free to e-mail
me at chmrig@leeds.ac.uk or write to me at:

RICHARD GORE, 79 SPROTBROUGH ROAD, SPROTBROUGH, DONCASTER, DN5 8BW

> to recall that there are many disks to the game. Somebody help me, please!!

Oh dear! I'm not going to say that Toad ripped you off since they're apparently a decent company ... usually. Alternate Reality (I assume you have the City) comes on two disks. If I recall, part two (the Dungeon) also comes on two disks. I would strongly recommend that you get hold of an unused copy since the packaging itself is of good quality and well worth the extra.

Both volumes are available from Micro Discount in the UK. I can't remember the price (I think it's about 15 - 19 pounds for both?). If you want me to find out, send me a message to get me off my butt.

I deal (or at least speak) with Derek Fern at Micro Discount on a regular basis and can vouch for his integrity. Mind you, I'm going to be speaking to him a lot over the next couple of weeks because I'd sent him my only 1050 drive to be upgraded and services ... and the bloody post office has gone and lost it!!!

Subject : #3803 Atari Base
Sig(s) : 1 (General Information Files)

Hi Larry and everyone else that is interested. In response to your question, I called the Atari Corp. this morning and spoke at length to Don Thomas. He says that the person that was sysoping the board left the company but was doing it remotely. It seems everything is going to pot and he has decided to shut the board down for now and perhaps permanently. There doesn't seem to be anyone there that can handle the software or who knows how to fix the troubles that the bbs seems to be having. So rather than fumble around any longer he is just going to shut the board down. So that's it for now. Joe Fischer, Sysop

Tim; if you really want to see if the 1030's busted, have all your drives other stuff on the SIO line off. With the 1030 on, switch the 800 on while holding down the OPTION & START keys. The built in modem software for the 1030 should load. If it doesn't work, I wouldn't worry about buying software for the thing, it may be to badly broke.

I already *have* the software for the 1030. That's why I want to get this
thing to work--so I can download better comm software for faster modems!

What does holding down START do?

When I hold down OPTION, I get a high and somewhat wavering squeal from the
TV speaker and then I get to the MODEMLINK program.

It's *in* the MODEMLINK program where the program reports "Modem Power
Lost." So apparently, the modem had the power to load the program into
the 800XL, but somehow loses it when the program is up and running?

The "power lost" message is consistent with the message that 1030 Express!
returns to me: "Turn on modem and reboot."

MODEMLINK lists 4 options; the message appears on the line below option 4.
I can choose option 1 to dial, but after I enter the number, the screen
gives a quick "Dialing 555-1212" message before the screen goes blank,
with no sound, seemingly hung.

It's hardly worth losing a lot of sleep or putting much money into, but
I think it would be a good experience (as well as a cheap electronics
experiment if it's a hardware problem) if I could figure it out. Obviously,
if the problem is in an expensive part, I'd forget it and throw the darn
thing away, but if it's a cheap 50-cent part, maybe I could try to replace
it for fun and practice...

sigh

Another one bites the dust.

I'd really love to help support stuff like this, but I don't know of
any Atari BBSes or user groups in the San Jose area. I guess that in
the rush-rush high-tech Silicon Valley, this stuff has been long
forgotten. At least by prominent users, anyway; this area still
boasts a lot of support with respect to Atari dealers--Best, B&C and
American Technavision are all no more than 30-40 minutes away.

My 600XL came with an 800XL/XE os. However, BEST has listed a specific
catalog number for the 600XL OS. Whats the difference?

Er hardwired CX85? I have some schematics laying around somwhere
do to that. I found it in the middle of some obscure User group
newsletter from the mid 80's. Was pretty cool, you could choose
which keys did what. You had a 15pin connector on the side of the
8bit and the keypad. (think it was 15.) And it worked with everything.

Of course, a 101 FOCUS keyboard and transkey just don't compare though =)

: Andrew,

: Care to elaborate on how one can use an 800 with an RBG monitor??

: I am sure a few of us are wondering the same thing.

Off the top of my head you pull the signals off of chip A103.
If you have an RGB monitor where you can adjust the signal
then the design is simple, other wise you need a few trimmers as well..

Its just a few resistors and transistors with 3 trimmers. Very
simple circuit. I was thinking of building some little external
box that I pluged between a new video jack (from the A103) and an
RGB. But since I don't ever really use my 800's and since I don't have
a vanilla RBG monitor. I never did the hack. I found it in an old
Atari Users group newsletter.

I think that limiting base size is important to people who don't have the space to have 'unlimited' message sizes or space (that explnation was in my original post).

Not all of us can have 200 megs worth of message space, not all of us want 200 megs of message space.

So no it's not strange if one is not trying to communicate all over the world with mostly taglines that take up unecessary drive space in message bases. Some of us still like thing simple and straight forward.

But not for the computers. I wonder if it had to do with this fact.
The 5200 cart port allowed for 32K of ROM space. The 8-bit computers
only 16K. (disregarding banking) Perhaps Atari just didn't want to
bother converting it to a banked cart version? (Vanguard file is
21K long).

The MIO is probably better if no you have ramdisk in your 8-bit, then
you put most of the core BBS modules on the ramdisk for extra speed.

The 256 byte sector problem isn't that much of a problem these days
because drives tend to have configurable byte sectors now (or so I've
been told.)

Also, partition swapping software tends to be more available for MIOs
than BBs, to allow you to have a larger BBS with PRO!.

Yeah, but I was planning on doing it to a 1200XL. That's the problem,
though, because the jumperpoints would be different on a 1200XL from a
standard XL/XE... These hack files usually don't address all machines.

Hmmmm... You know Bill, this kind of sounds like the original MUX design for
the Corvus drive on my 800. Different users logged on to the system and
their logon was used to run a small basic program to load a mount table to
mount a number of Corvus Volumnsthat were for that user to use. The user
couldn't change the mount table or access any other Corvus Volumns. Some of
the volumns would be general purpose for all users, some just for that one
user. Wasn't there a BBS that used the Corvus?

The Axlon is for the 400/800; gives the system 52k RAM (up to $CFFF).
The $C000-CFFF 4k block can be banked (with 4 banks available).
I don't think it would work right with Omnimon, though (it also occupies the
$C000-CFFF area).
I think that with 3 of those an 800 could have 192k accessible (mostly 4k banks
but heck, not bad for 1982)

I've got Pitfall (just the original). The computer version is just like the 2600 version; I'd hoped that they would have spruced it up a bit. Still fun, though.

Dave

2254. MIO vs Black Box?

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-14 11:24:18 UTC
From: Amos.Jackson@flight.org
Message-ID: <fe2_9503141226@flight.org>
Source record: 93598

$140. for the cart and the MIO is a good deal.

As far as which is better, it depends on if you want more hard drive flexability, or you can live with 1 meg of extra ram and a straight out 256 byte sector count on your hard drive(s).

I use the MIO, and find that it is very useful, and it works well with my bbs. The extra ram helps the board run VERY fast.

'Fraid not, I'm assured he charges 25 UKP for a SIO2PC cable with software.
So now the teaser, does anybody out there (preferably UK, but I will pay
postage from US if needed) have a SIO2PC cable in good working order to
sell for a decent price? I got my 850 interface yesterday, but it's just
not the same.

Cheers, Ric.

2258. Problem with XF 551 floppy

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-14 18:37:48 UTC
From: elmi@extra.rwth-aachen.de
Message-ID: <elmi.15.0012A1D7@extra.rwth-aachen.de>
Source record: 93506

Hi,

I installed a switch so that *I* can decide wether writing to a disk is
allowed or not without biting a hole into every disk.

Writing to the second side is no problem but formatting does not work.
A 1050 drive can format the second side.

Does anybody know how to get this working?

I think the index-hole in the disk is needed for formatting. But why can the
1050 format the second side?

Thanks for your help

Elmar

Elmar Bongers, e-mail: elmi@extra.rwth-aachen.de

2259. Gtracker uploaded again

Newsgroup: comp.sys.atari.8bit

2260. ***800 to MSDOS: Any Ideas..?***

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-14 19:34:10 UTC
From: thunderjet@delphi.com
Message-ID: <5q87ewq.thunderjet@delphi.com>
Source record: 93600

I have been handed a challenge.. convert a half dozen 5.25 Atari 800
disks (c. 1982?) to MSDOS 5 or 6.

So far the disks have travelled across the country three times
to various conversion services, all unable to convert the disks.
The disks are readable as we can see the text through the
Atari Writer rom program. Disk drive is a 1050.

We have thought about printing through the oarallel port to
a receiving PC but we do not have the pinouts to create a
Atari 15pin to DB9 or 25 adaptor. Any help here?

If you know of a conversion service, commercial or private,
that can handle this task please drop a note to
Thunderjet@Delphi.com (Chemical Bank RCSG Help Desk)

Thanks in advance!

: megs of message space.
:

I dont know.. if you're going to run a BBS, you should have at LEAST 100meg
of space. I have 800meg on my little atari 8bit BBS - and would LOVE to
increase the message capacity. Having to take one captured message
of 10k or so and slice it into 10 peices just to insert it into a base is
a waste of time and energy.

This won't give you RGB. GTIA produces a color signal that is far from
RGB (it's practically chroma right off pin 21), so getting RGB involves
chroma decoding which your composite monitor does. I've worked many hours
on a device to produce real RGB without chroma related loss, but I haven't
been too successful yet (and frankly, I haven't had much time to pursue it),
but working with 60MHz clocks and such to try and accurately sample the
chroma signal haven't worked. GTIA just isn't that accurate.

2265. Journal idea

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-14 21:57:26 UTC
From: heller@akh104.rh.psu.edu
Message-ID: <3k53g6$rb1@hearst.cac.psu.edu>
Source record: 93505

Well, I have been sitting here putting off studying for mid-terms
and wanted to continue to do so for a while longer. I just received
the Dec issue of Nybles and Bytes. They were talking about a sketch
pad for the 8bits and how they had been in storage for over 10 years.

Well, this got me thinking again of an old idea. One of many ideas
actually, another one was to have an Eastern US Atari users group..etc..
of course I think that is now being taking over by NEAR*US or some
such thing. Another idea was to always have my own newletter, or to
atleast write for another such as Atari Classics. Well, this idea
was to dedicate each issue (At least the majority of it) to one
specific device in the Atari line. I'd call it the "History Page" or
some such non-creative title. Imagine if you will the following:

You just get a THICK (40+ typeset pages) new Atari mag in the mail.
(Come to think of it, It will be called "Technical Reference Notes"
hehehhahahahh. .. "Notes" as in "Current Notes"..um..anyways..).
This issue (for example purposed ONLY) is all about Atari tape drives.
It would start with the history of the 410, from creative concepts, it
would have perhaps, notes from the designers and what they were thinking
when they designed it. It would move on to the various incarnations
of the 410 (all those other brands from around the world).. then onto
the 1010, then the rare and strange XC units (2 of them as I recall,
why they made 2 models is beyond me). But you would have the reasons
why.. the HISTORY man!!!

Then you would have FULL schematics of the units
how they work, why they don't work, then changes in the 8bit os from
REV B to the XL's. How to fix them to make them work (I actually read
an article recently about how to fix a 410 so as not to have load
problems anymore!!!) You can have schematics of neat hacks, like one
I saw that lets you plug the SIO line into a little circuit that then
plugs into standard tape recorders. No more Atari needed equipment.

The schematics would be full tech note releases with some various
info from the repair manuals etc thrown in. Then you could put in
the educational concepts such as how to add voice tracks etc..
Then you would have complete, known list of all tape programs for
the unit.

Even better still is you would have a blow out bargain sale for
the month of the magazines issue. The people in charge of the mag
could get a large selection of NEW 1010's or 410's and offer them
to the readers. Or, print up special coupons that can be cut out
(or copied) and then mailed to B&C or whomever wished to sponser
the current months piece of hardware. "Brand new 1010's for $15

and for another $7 get the full tech manuals and repair manuals"
offer expires at the end of the month. Of course anybody could
sponsor it who wanted to get rid of a large pallette or 12 of some
units.

Next month we will be looking at the rare Atari 815 and comparing
it with the 810 (and the rumored DD drive! for dos 2.0d, by the way
does anybody have a copy of this dos?, was the 815 double density?)
(anybody got one they want to part with? someone had an 830? and
an 815 they wanted to unload on me last summer but I never got
back in touch with them...)

Another issue could be devoted to all the BOOKS ever published for
the Atari, such as all the COMPUTE! books, all the odd ball books,
(and let me tell you, I have some ODD books for the 8bit..I have
a book on "The very best Atari software" published in '84.) Anybody
still have large quantities of COMPUTE! books? (I need a copy of
their guide to DOS 2.0).

I like this idea A LOT. Yes, it would be very hard to do all the
research, but since we got guys on the West coast whom see to know more
than the people who built the machines, it shouldn't be too far out of reach.
And think of all the money the companies that support the 8bit could make
on such advertising/deals. (Better to make the coupon not to have an
expiration date. That way, some new people can order back issues and
still get the deals.)

Is it me? Does this sound like a GREAT concept? Or am I gonna have
to resort to studying "Computer System Architecture"? (Boring stuff
really, I know it all too well... yes, this is how mico operations work
and how to convert it to hardware, yes, take Booth's multiplication
method and design a circuit to implement it using digital IC's, then
draw the TTL level cicuit complete with transistors and diodes or
using VLSI designs...) blah blah... oh..to dream..

HEY WE COULD HAVE AN ISSUE DEVOTED TO THE 1400XL! and then the 1450XLD!!

Some of the problem I've had with message base programming on the 8-bit is editor size. Of course, a text dump or download would do (but I never got to file xfers when I wrote my latest BBS, it was going to be (don't laugh) an external door.. thing is I only had 2 1050's (254K) and a 192k RAMdisk online!).

Another problem I see some programs having is they allocate the message space in advance to quicken the read/write process. If you want message base #1 to have 10 message at 10K a piece, it wrote out a 100K file and kept track of the sector/track location via. a DOS "NOTE" command in another file (which it used also within the BBS) and then if someone posted a message and it was message #9, it wouldn't have to do a RANDOM I/O >READ< of 90K, it'd just do a quick POINT to the "90th K block" of the file.

This is a bit archaic in my opinion as we now have HD's and RAMdisks and the like to take care of speed for us, but back in the floppy drive days (yeah, last year or whenever when I had MY BBS up! :)) it was useful.

If you're wondering, my BBS used separate files for each message.. sure, it took a second for DOS to locate the file, but it worked well enough! :)

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

The Suburban Chicago ATarians (SCAT) user group will hold its March meeting on Tues. March 21 at 7:30 PM at the College of DuPage, Room K 157 (the K building is on the south side of 22nd St. just west of Lambert Rd., in Glen Ellyn [IL]). The scheduled demo is: <to be determined>. (Maybe I'll videotape some graphics on my TT for the benefit of all you guys who had the flu or whatever last month! I'll bring the 8-bit system too, I've still got that Cable Board screen-set that I used at a party and wanted to show you all...) Impromptu demos are always welcome - but SCAT doesn't have the STe yet :-/

Everyone is welcome to attend. (Especially anyone who is thinking of joining SCAT :-) Feel free to bring your family.

For more information, send me E-Mail at one of the addresses below. [If this article shows up outside the greater Chicago area, I apologize - the "chi" distribution may not work (at all sites) now. Say, if you're travelling to the Chicago area and will be free that evening, feel free to stop by!]

I've got Pitfall II - on tape only though. Used to drive me mad when I got
"killed" and it sent me back to the last "what's-it" that you stood on, but
some of the things were quite cool - like the balloon scene.

Hmm, maybe I should convert that one to disk...

>go, what are the exact differences between the Atari 400 and 800? And,
>does anyone know of any Atari 400's for sale cheap?
>
The 400 came stock with less memory (8k or 16k vs. 48k for most 800's) has
only one cart port (2 for the 800) has no monitor output only rf, has a
membrane keyboard vs. the 800's rather nice full stroke one. Both have the
same OS and 4 joystick ports, the 400 is not as easy to upgrade in terms of
memory or other hacks and I got mine used for $10 bucks. I'm sure you can
run basic com programs in as little as 8k but 16k and even 48k 400's are
around dirt cheap, so why settle for 8k? I found mine at a used computer
store here in Rohnert Park, not exactly Silcon Valley, so there has to be
more anywhere else!
Not a bad computer if you can tolerate the keyboard (or find a b-keyboard
replacement some where.)

>
Okay, I'll let my 48k 400 go for $10 (I'll even replce the missing
joystick connector on JS4) plus shipping. That should be enough memory to
run all the early software and PD stuff. I've hung onto it for sentimental
reasons (my first computer was a 400!) but I never use it and I'd like to
see another Atari user in the world.

I have heard here that a 400 can be connected to a monitor (vs. a TV) but
is not a simple hack.

2284. A game for kids...

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-15 08:16:50 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <FCPVBDUQUp@stingray.manawatu.gen.nz>
Source record: 93524

Whoever it was that wanted a game for some young kids...

I wrote a game about 8 years ago (I think), which isn't brilliant, but not too hideous (for kids anyway I guess).

It's a car race through a maze game - 1 or 2 players - if 1 player, then the computer plays as the 2nd player.

If you want it, I can e-mail it to you - it's about 9K - basic file, with some machine code (which I did by hand, as I didn't have an assembler in those days - boy did I have fun with the maze generation routine...)

Don't expect anything as cool as Boulder Dash II, and Encounter though...

Richard =8-]

PS. I wouldn't feel nervous about new competition, Bill =8-]

2286. HyperIt! v.0.5 beta almost ready

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-15 09:45:29 UTC
From: kendrick@zippy.sonoma.EDU
Message-ID: <9503150945.AA03538@zippy.sonoma.EDU>
Source record: 93527

I've spent the last ~2.5 hours working on (and actually reworking) HyperIt!

I've turned it into three separate executables:

1) Title / Initialization
2) File selector
3) Stack viewer

(Looking back I believe I can put #1 and #2 back together, and I feel having the viewer separate could be handy for other people's demos!)

Additions I've added over 0.4 have been:

1) JUMP and RETURN commands (like GOSUB; the original LINK command is like GOTO (and yes, is still in HyperIt!))
2) BEGINTEXT / ENDTEXT commands (people (rightly) complained about the MORETEXT command being a pain in the rear)
3) The file selection screen's "Drive/Path" entry window now works (almost)
4) The file selection screen's "Stacks" list window now also displays subdirectories, and you can "Open" them (copy their name onto the end of the current path)

Before I release 0.5, I'm going to have to:

1) Test JUMP/RETURN more
2) Maybe add a "CONTINUETEXT" command (I found a place where I could have used it: when you do a "TEXT", add a button, and continue with MORETEXT's)
3) The "Drive/Path" entry routine has a bug (I think I was tired when I typed one line of code and it screwed it all up! :))
4) Test the "Stacks" window subdirectory selection for multiply-nested subdirectories and subdirectories with extensions in their filenames.
5) Find out why now when I go to "RunIt" ("Chain") from the Viewer back to the File selector it crashes and when I hit [Reset] it reboots!
6) Fix the pointer-handler

I should have this and more done by this weekend, so if anyone would like an updated beta copy (v.0.5) please let me know.

It requires:

MyDOS 4.53 (I'll add SpartaDOS support (if I CAN!) before the final release)

I recommend:

A fast drive (Hard drive or RAMdisk) (Stack I/O and program execution eats a bit of time)

Send me e-mail at: kendrick@vax.sonoma.edu

Supposedly usenet uses that approach. But unix isn't limited to 64 files
per subdirectory. That's why using fixed max msg size allocation on one
contiguous file and note/pointing through it via Sparta's random access
system (which MYDOS lacks) became the defacto standard.

Bill,

If you can program in C anyway then why make the PC version so...
well, BASIC - there are numerous PD graphics and sound C libraries
on ftp sites.

I think it is a lot nicer having the sound out of a sound card.
My PC speaker is so loud that it is annoying to the extent of not
playing the game if it has speaker sound only.

Just my opinion,

Ivan

>more anywhere else!

Heh. I picked up a 400 for basically free a few weeks ago ($5 for a 400,
paddle controllers, power supply and SIO cable) but I'm still at a loss
to describe what's wrong with it or how to fix it.

Basically, the keyboard functions normally until you press the RETURN key,
at which time the video starts printing garbage characters. Certain letters
might always get mapped to some strange ATASCII character when being output.
If I had any idea which chip was causing this problem, I'd try to replace
it...but I really have no clue.

It's a good (and basically free) game-cartridge player...at least for
cartridges which never use the RETURN key. I can play Star Raiders on it,
since I never need to hit that key.

From: ziggy29@rahul.net
Message-ID: <3k73ck$mgo@butch.lmsc.lockheed.com>
Source record: 93536

Well, I've give up on my 1030. I'm in the process of acquiring a
9600 bps modem to use instead. I've already got the 850 cable as well.
What I need now is something to plug the cable in to (such as an 850,
P:R: connection, MIO or Black Box) and some communications software.

If anyone has one of these they'd like to unload, you have a taker
here if the price is right. I'd also appreciate it if you could include
a disk which has a terminal emulator/comm software on it--one which can
do file transfers and does not require an XEP-80.

Please send e-mail to this account if you can help...I thought I
had a P:R: connection secured, but the guy selling it here decided
to cancel the sale and sell it to a local buyer...

>and decided it was time to get active again!

I clearly remember I had a tape copy of this game in 1986, it was probably
a copy of the original ROM image. However, that version did not work on
XL computers. I looked into the code and found an incompatible call to
some 400/800 OS ROM address. Then I found the corresponding OS address in
my XL computer, changed the call, and suddenly River Raid worked.

It was, for me, a great achievment at that time. Talk about bringing
back sweet memories.

Tim; This is THE Atari Base as in Atari Corps in Sunnyvale. If you really want to try, just phone them up & ask if they would let an outside sysop run it. There's sort of a history of people doing this that goes back 7 or 8 years to the Michtron BBS days at Atari. What happened though is as the ST computers became increasing obsolete, people familiar with the computer became harder to find. Bob Brodie, former head of Customer Relations or something like that, left the company so that's why it's hurting now. I think the board runs on some flavor of Mega ST so you would have to learn to fool with them beasties.
BTW: (408)9860215 is BAAUG's bbs number. It doesn't get much traffic, but it has some 8 bit files. When the club went ST they kind of unofficially excommunicated the 8 bit. There's still a few of us around though. It looks like the club will become 'informal' <translation: Drove off the 8 bit users & when Atari dropped the ST line the remaining users became hard to find> with no dues/meetings open to anyone. It meets at Agnew 1st Monday of the month.

Ok, I think that's enough info to make a guess. I've had the same exact symtoms on 3 or 4 modems from different manufacturers. What happens is they use a relay to do things like simulate the reciever being picked up to dial. What happens is the coil of the relay shorts out & everytime a command to dial or check for dialtone is given, the power supply shorts out through the relay & blamo. DO NOT PUT A SERIOUS 9VAC POWER SUPPLY ON THIS THING! Just keep going with the wall warts with less then an amp if you want to keep fooling with it. You'd be suprised at just how much smoke they can generate if this is the problem<g>.

>I know very little about it, and there hasn't been much about it here either.
>All I know is that it was intended for Eastern Europe...
>
The 800XE is completly the same as a 130XE, has the same motherboard and so on !!
The only differences are the types on it (800 instead 130) and that the 64kb upgrade Memory aren't on the board yet (with to other chips for memory switching - but the Freddy is there yet).

Matt

>XE).
I don't know where do you have your information from, but the 800xe has the
same case and the same board as the 130XE and it has not PBI but ECI.
Belive me - I have one and I've just opened it yet.
Of course, there do exist a small number of 800XL with a redesigned board
and Freedy Chip- but this are still XL and the board is completly different
than the 130/800 XE ones.
However Freddy's there. The 800XE by default still only has 64Kb of
>memory although since Freddy is capable of handling more it's common to
>find 256Kb of memory in these machines.

I 've checked it up a little bit- there are no great differences - but some routines are located at other points in these ROMs - but they are still the same - don't know what the effect of this should be !!!

Um.. as I recall the 800XE's that I know about are the same in shape
as an 800XL but the board has 800XE screened on it. What name is on
this 65XE/130XE half breed board?

send usenet/news.answers/atari-8-bit/vendev
quit

Finally, you can always ask me for a copy at URL:mailto:mcurrent@carleton.edu

Conventions
-----------
All commercial vendors, developers, and publishers should be listed here.
"Major" shareware/freeware/PD developers should also be listed.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, public domain
software/freeware/shareware, commercial software, used (commercial)
software.
```

"Developer" = Producer of products. Titles of products produced by the developer are listed. No product can be developed by more than one developer. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information is given, including prices.

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

I collect information for this list from wherever I can find it. While most updates to this list come from you, the user of the list, I'd like to recognize a few of the more prominent sources I use. Current Notes magazine, and their 8-Bit Editor Rick Reaser. Atari Classics magazine, published by Jim Hood and Bob Woolley. And The Atari 8-Bit Omnibus, published by David A. Paterson.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

2305. Atari 65xe video upgrade

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-15 20:10:05 UTC
From: jeking@xmission.xmission.com
Message-ID: <3k7hit$2uf@news.xmission.com>
Source record: 93546

Are there any video upgrades for the 65xe? AC's article on SuperVideo included virtually ALL computers EXCEPT the 65xe. My 65XE sucks on a commodore 1702 - as it apparently has no split luma/chroma.

How simliar are the 130xe and 65xe? Could I use the AC 130xe video hack on a 65xe?

(blah, blah, blah)
>Nick DiMasi, SCAT President

"SCAT"????!!!! Nice name for a user's group!! According to Webster's
New Collegiate Dictionary, the number 3 definition of "scat" is:
"an animal fecal dropping." Could this be referring to the Atari Falcon
and Jaguar lines?
---Mark van Wyk

2307. Atari 400 Setup 4 Sale

Andrew K. Heller <heller@akh104.rh.psu.edu> writes:

> You just get a THICK (40+ typeset pages) new Atari mag in the mail.
>(Come to think of it, It will be called "Technical Reference Notes"
> hehehhahahahh. .. "Notes" as in "Current Notes"..um..anyways..).
>This issue (for example purposed ONLY) is all about Atari tape drives.
>It would start with the history of the 410, from creative concepts, it
>would have perhaps, notes from the designers and what they were thinking

Sounds like an interesting idea. I dunno if 40 pages would be
enough for some topics, tho. Might have to split some topics into two
or three (or more?) issues. :)
There are many "magazines" right now that publish in a curious
(to me) fashion. I just learned of this recently, from a friend who
is participating in one. What they do is this: Someone decides to
start a magazine on, say Role Playing Games. They get the word out
(ads in other RPG mags, bulletin boards, Usenet, whatever),and ask
for contributors. Each contributor pays a certain amount based on the
quality of the magazi they wish to receive (more on this later).
Then, each contributor writes an article each month, sends it in,
and the person who started the mag collects them all, has them printed
and bound according to the contributor's individual wishes (ie, wire
bound, loose, binder, "hot Glue" hardbound, etc. Each contributor
gets the binding he or she paid for). Then, the magazines are
re-distributed to the contributors ONLY (ie, not made for sale to anyone
else). They read eachothrs articles, then work on their contribution
for the next issue.
Perhaps we could do somethin of the sort in the Atari community.
With all the knowledge available here, we could certainly make available
all the knowledge you talk about wanting. :) And, it would be self-
supporting . . . and self-published. So, you get none of th horrors
that dealing with a major publishing hose can give you.
Just a thought . . .

-Joe

Andrew K. Heller (heller@akh104.rh.psu.edu) wrote:
: Well, I have been sitting here putting off studying for mid-terms
: and wanted to continue to do so for a while longer. I just received
: the Dec issue of Nybles and Bytes. They were talking about a sketch
: pad for the 8bits and how they had been in storage for over 10 years.

I just got Jan./Feb. '95...

: Well, this got me thinking again of an old idea. One of many ideas
: actually, another one was to have an Eastern US Atari users group..etc..
: of course I think that is now being taking over by NEAR*US or some
: such thing. Another idea was to always have my own newletter, or to
: atleast write for another such as Atari Classics. Well, this idea
: was to dedicate each issue (At least the majority of it) to one
: specific device in the Atari line. I'd call it the "History Page" or
: some such non-creative title. Imagine if you will the following:

I've often figured that if there was ever another Atari rag coming out,
this was one area where I could *definitely* be a meaningful contributor.
I could easily write columns for a "nostalgia section;" I'm not a real
Atari tech guru (yet) but I've played with the 8-bit going to back to,
oh, 1981 or so.

: You just get a THICK (40+ typeset pages) new Atari mag in the mail.

[...]

: Then you would have FULL schematics of the units
: how they work, why they don't work, then changes in the 8bit os from
: REV B to the XL's. How to fix them to make them work (I actually read
: an article recently about how to fix a 410 so as not to have load
: problems anymore!!!) You can have schematics of neat hacks, like one
: I saw that lets you plug the SIO line into a little circuit that then
: plugs into standard tape recorders. No more Atari needed equipment.

Now *this* would be cool. I'd love to see more detailed schematics.
And troubleshooting. Lots of troubleshooting. With 8-bit parts becoming
scarcer and scarcer, and with fewer and fewer support avenues, this
would very much come in handy. I'd love to try to fix my sick 400 if
I had any idea where to start.

: The schematics would be full tech note releases with some various
: info from the repair manuals etc thrown in. Then you could put in
: the educational concepts such as how to add voice tracks etc..
: Then you would have complete, known list of all tape programs for
: the unit.

This is, of course, just for the 410/1010. I assume this would also be done for other components, perhaps one or two with each issue? I could see even fairly common things like putting a US Doubler into a 1050, for example, or expanding memory in an 800XL.

: Even better still is you would have a blow out bargain sale for
: the month of the magazines issue. The people in charge of the mag
: could get a large selection of NEW 1010's or 410's and offer them
: to the readers. Or, print up special coupons that can be cut out
: (or copied) and then mailed to B&C or whomever wished to sponser
: the current months piece of hardware.

Well, sure, if you could convince vendors that this will enhance their long-term survival (by helping to maintain and create a market for their products), then this would be quite useful and could even pay for a subscription (if one was charged).

: Next month we will be looking at the rare Atari 815 and comparing
: it with the 810 (and the rumored DD drive! for dos 2.0d, by the way
: does anybody have a copy of this dos?, was the 815 double density?)
: (anybody got one they want to part with? someone had an 830? and
: an 815 they wanted to unload on me last summer but I never got
: back in touch with them...)

No 815 here...just three 1050s--two hooked up to the 800XL and one to an 800 (just to play games incompatible with the XL OS; i.e. M.U.L.E.). Can't help you there.

: Another issue could be devoted to all the BOOKS ever published for
: the Atari, such as all the COMPUTE! books, all the odd ball books,
: (and let me tell you, I have some ODD books for the 8bit..I have
: a book on "The very best Atari software" published in '84.) Anybody
: still have large quantities of COMPUTE! books? (I need a copy of
: their guide to DOS 2.0).

I just placed an order through American Techna-Vision for five Atari books for $15--three of them are in the COMPUTE! series.

: I like this idea A LOT. Yes, it would be very hard to do all the
: research, but since we got guys on the West coast whom see to know more
: than the people who built the machines, it shouldn't be too far out of reach.
: And think of all the money the companies that support the 8bit could make
: on such advertising/deals. (Better to make the coupon not to have an
: expiration date. That way, some new people can order back issues and
: still get the deals.)

As long as the the vendor could ensure continuous stock of the items being advertised, perhaps.

I'd like to meet a few of these West coast gurus, actually...I'd love to be able to learn a lot from the masters as I astrive to develop my own "guruhood" in the 8-bit.

: Is it me? Does this sound like a GREAT concept? Or am I gonna have
: to resort to studying "Computer System Architecture"? (Boring stuff
: really, I know it all too well... yes, this is how mico operations work
: and how to convert it to hardware, yes, take Booth's multiplication
: method and design a circuit to implement it using digital IC's, then
: draw the TTL level cicuit complete with transistors and diodes or
: using VLSI designs...) blah blah... oh..to dream..

Not really. If I had the materials to learn the stuff very well, I'm
sure I could do it, and it sounds like fun. I'm sure there are lots of
others like me who probably know more to boot.

: HEY WE COULD HAVE AN ISSUE DEVOTED TO THE 1400XL! and then the 1450XLD!!

How much info could you get from for these? Throw in the 1090 while
you're at it... :)

Here's a question: What is the target audience? Hard-core Atariphiles?
Casual current 8-bit users? Budding wannabe gurus (like myself)? People
who are "on the fence" with respect to the 8-bit who need to see a bit
more literature and support before he/she takes the plunge? Some of the
above? All of the above?

Hey Richard! :) I was the one looking for kid games (or I was ONE of the people if there were more than one).

As for the game, yes, please send me a copy! :) But, I'd like to know some things:

1) Does it require keyboard input?

2) Is it "fast action?"

(This kid is 4 and she sucks at the keyboard and can barely keep up with my slow stupid "attack of the killer alphabet" game :))

Well, for one, getting a hold of a PC machine to program on other than in QBASIC is difficult. The only C compilers I have access to are for the Macintosh (and of course 8-bit Atari :)). The only LANGUAGE I have good access to for a PC is QBASIC (and it can run on my extremely slow, stupid, sucky, small, crappy PS/2 #25).

Anyway, if I do finally get a good PC (I think I'm gonna stick to Mac, personally..) and a C compiler, I'll of course make Cooltris 2 for IBMs! :)

>What modems can be connected to an Atari 400 without the Atari 850 Interface
>Module?

This is a bit of a loaded question. The Atari XM301 (300 baud) and SX-212
(1200) are direct connect via the SIO port. The Supra 300AT (300 baud) is
direct connect via the joystick port. You can also build an RS232 serial
interface for the SIO line for about $10 worth of parts. It can operate any
stnadard modem at up to 19200 baud.

There has been a fair bit of interest in that recently; I'll repost the plans
(as captured from csa8) and send them to the archive.

Hi! I have an 850 for you. I'd let you have it for really next to nothing at all. I can also copy a good terminal program.

I'm in Oregon at the moment, but I'll be going to Alaska for 10 days for spring break (in the snow), which is where my folks' house is.

There, I have a stack of 850s that all work. I don't have 850-->modem cables, but you have that already. Tell ya what - I'll send you one for *FREE* - just like to see another Atari user, and put a good 850 to use since nobody really uses them anymore.

I'll need to box it up with a power supply and SIO cable. You pay shipping only - which shouldn't be but a few dollars.

Hmmm..... I'm trying to think how I can check my E-mail to get your address. Go ahead and leave your address here, and I'll call down to the Unix system here and check my mail. It'll give me a good chance to test out said 850 and terminal software.

Let me know.... I'll probably call Saturday and check my mail.

James

>the video port.)
>I'm getting confused and if M. Hohman reads about this I'm sure he
>could clear it up.

Russ,

It's hard to know exactly what power supplies were shipped with
the MIO's over the years from ICD. The early units were shipped with
TRAK power supplies. (9V AC, and identical to the Atari 9V AC supplies)

It doesn't matter as to whether there is a video port or not, and even
though the 1 meggers will draw more juice, they still use the standard
9V AC supplies. (hence the 7805 inside the case).

They never used 9V DC supplies, as the actual voltage on the board is
5V DC...

The MIO's were notorious for heat problems, and I've seen many boards
where the diodes have turned the PCB black. It's best to just simply
pull the top cover off, and try to allow for sufficient airflow so that
they run a little cooler.

Hope this helps. Mike

2321. XFormer-Prob: NanaDOS, MicroDOS

Sounds like a job for SIO2PC to me! SIO2PC could capture the
printed output to a PC file. It requires the software for the PC,
plus a cable to adapt from the 15 pin open collector TTL SIO
connector of the Atari to the RS-232 9 or 25 pin connector on the
PC. I am sure you can find volunteers here to do this for you,
particularly as this seems to be a _real job_ <grin>. I currently
do not have an SIO2PC setup, or I would offer.

I have been handed a challenge.. convert a half dozen 5.25 Atari 800
disks (c. 1982?) to MSDOS 5 or 6.

So far the disks have travelled across the country three times
to various conversion services, all unable to convert the disks.
The disks are readable as we can see the text through the
Atari Writer rom program. Disk drive is a 1050.

We have thought about printing through the oarallel port to
a receiving PC but we do not have the pinouts to create a
Atari 15pin to DB9 or 25 adaptor. Any help here?

If you know of a conversion service, commercial or private,
that can handle this task please drop a note to
Thunderjet@Delphi.com (Chemical Bank RCSG Help Desk)

Thanks in advance!

****

I don't exactly know what you mean by converting but if you just want
to transfer the files (binary ot textual) from one machine to another
you can use some serial comms package on both machines. Upload
one the 800 and download on the PC using the same protocol
(E.G. Xmodem). This I have been doing for a while now to get files
from the Atari to the PC for Xformer.

If you haven't got hardware to connect the two machines together,
about 6 months ago I designed a interface that would connect
straight to the SIO bus and the PC serial port and would allow
communication (kinda like a null modem jobbie). If you want it let
me know and I'll drag the appropiate docs. together! However
if you ever heard of a disk mag Phoenix all the details are on issue
3. the interface is the one I used to transfer files.

Byeee...

Jason Keane.

Probably because I didn't think the thing was even worth the shipping
charges to anyone. I bought it at a junk store for $2, and I guess it's
just that...junk.

>The 1030 makes for a very attractive project box, and chances are the power
>supply is still good.

Well, I have a generic (i.e. not 1030-specific) 9-volt, 800mA power
supply which I planned to put to another use. And it was the
"electronics lab" aspect of the thing which made me want to keep it
and try to fix it. I was hoping to learn something.

Actually, a project I'd love to see is developing a modem faster than
1200 baud which could use the 1030 case and just daisy chain via
standard I/O rather than requiring special interfaces and cables.

If nothing else, someone else with a broken 1030 might be able to use
it for parts.

2329. Atari 850 serial ports info WANTED

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-16 16:32:58 UTC
From: CONRADUS@PLEARN.EDU.PL
Message-ID: <199503161632.KAA26440@mail.cs.utexas.edu>
Source record: 93469

Hi.

I want to connect all my computers by RS-232, so I have to do a null modem cable between Atari 850 and Falcon. I remember, that the 850 serial ports scheme has been posted to this group, but, unfortunately, I drop this post somewhere in my room (there is a lot of papers and I am sure, that the printout is there, but I cannot find it). Can anyone send me the desired scheme? Thanks in advance.

: >the video port.)
: >I'm getting confused and if M. Hohman reads about this I'm sure he
: >could clear it up.
:
: Russ,
:
: It's hard to know exactly what power supplies were shipped with
: the MIO's over the years from ICD. The early units were shipped with
: TRAK power supplies. (9V AC, and identical to the Atari 9V AC supplies)
:
: It doesn't matter as to whether there is a video port or not, and even
: though the 1 meggers will draw more juice, they still use the standard
: 9V AC supplies. (hence the 7805 inside the case).
:
: They never used 9V DC supplies, as the actual voltage on the board is
: 5V DC...
:
: The MIO's were notorious for heat problems, and I've seen many boards
: where the diodes have turned the PCB black. It's best to just simply
: pull the top cover off, and try to allow for sufficient airflow so that
: they run a little cooler.

Mike:

Trouble is, the thing used to work perfectly when I got it, with the top closed, for hours at a time.

Then I moved and set it back up, and it immediately causes problems. Example: With any cartridge installed, when I hit '0' to exit the MIO page, it drops into Memo Pad mode (or Self-Test actually).

Lately, in addition to that, there are times when it prevents the floppy from booting, or will simply make the floppy stop booting and freeze. But if I power down and unplug the MIO, everything is fine.

Wow!! Just the guy to answer all my questions!! :) I tried to do the 800xl OS in a 1200xl mod and failed. I get a corrupted character set on the screen that continually degrades itself into jibberish. I know all the parts I have work correctly (i.e. the MMU and OS chips). I was wondering if you could shed light on my problem. The computer goes right into self test mode upon bootup, and they seem to run. The audio test works, but the video is corrupted beyond imagination. Same deal with the key board test... Help!!
BTW, I didn't put in basic, as I'd rather pull the cart...

>back to having more fun. Mine craped out. Email me at the address above.
>Lowest price wins!

I just thought I'd mention for the benefit of anyone who has a crapped
out 1050...American Technavision is currently selling the 1050 drive
mechanisms for $14.95 each, or 2 for $24.95. They look like they
should be fairly easy to replace; I just placed an order for two of them
as an "insurance policy."

Of course, if your 1050 crapped out on the PCB (electronics) and not in
the mechanical drive mechanism, I guess you'd need a 1050 PCB. And I
don't know what they're going for these days.

Of course, if you're not inclined to do the replacement work yourself, I'm
sure *someone* out there has a 1050 they want to get rid of... :)

: ---Mark van Wyk

Heh. This reminds me of the light rail line that goes through San Jose, and when (circa 1987) they were looking for a name. They originally chose "Santa Clara County Automated Transit" or something like that--which they (trying to sound geeky and hi-tech; this *is* Silicon Valley) billed as "SC^2AT." Of course, the "2" was a superscript, so it really looked more like "SCAT." The name lasted maybe a week amidst a lot of ridicule by the public and the local press. :)

Typically, I guess any of the daisy-chain modems in the Atari line; that would leave the 830, 1030, XM301 or SX212. (Would a guru please correct me if I'm wrong?)

All but the SX212 are 300 baud. The SX212 is a speed burner at 1200. :)

I managed to dig some old back issues of Computer Gaming World out of a box in my closet the other day. Damn, there are some memories in there.

Most of the back issues are in the 1982-1986 era; there were really some memories up to around 1984 (when *everything* became Apple [grumble]).

One of the issues in early '83, in fact, had a review of M.U.L.E. in it. In fact, it had articles written by Dan Bunten before that game was even released. There was a special Atari column with each bi-monthly issue, and you could find ads which sold cartridge games for $40.

Anyone remember Time Zone, the huge (for its time) Sierra On-Line effort? There's an ad for that one--suggested retail price $99.

One of the most interesting nostalgic pieces was a couple of pages which listed all the major releases of 1982. From A.E. to Zork III, they were all there, about 140 of them.

I feel like I'm 18 again. :)

Rick, what all do you want with the cable? Full blown in box or are you willing to put it in a box your self? I'm getting a little back logged on projects<again>, but I could probably wire wrap up the two I owe + one for you if you like. If you want to keep it non-commercial, it's been 25 years since I visited England. I miss the good breakfast tea. An appropriate quantity mailed in return for a cable would be sufficient. You see we have this problem in America, about 200 years ago so smugglers <whoops! 'some'> in contraband tea got upset when England provided us with low cost high quality tea. They ended up throwing the whole batch in Boston Harbor. You guys got so upset you abandoned us by 1776. We now have this ugly trend where people collect garden prunings, mix them with the parts of citrus you usually throw away, & call it herb tea. Really a putrid mess!

2347. RS232 cable to Atari 8 bit joystick port

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-17 07:38:09 UTC
From: henry.chen@mgasoft.ersys.edmonton.ab.ca
Message-ID: <9503170413111155@mgasoft.ersys.edmonton.ab.ca>
Source record: 93504

The other day, someone listed a schematic for making a cable which connects from a standard IBM RS232 port to an Atari 8-bit joystick port. I captured the file, but then it got accidentally erased.

I would REALLY appreciate it if whoever it was could list this again. And do you need some sort of "TSR" (although this word wasn't yet in use at the time of the 8-bit) to run this kind of setup?

I also have well over 1000 programs in my closet of Atari 8-bit related programs. Are there any BBS's where one could still upload or download this kind of software?

2348. 800 - MSDOS

Newsgroup: comp.sys.atari.8bit

: same letter. I tired flying them around in a circle but that doesn't seem
: to work! Anybody?

: Jason Keane

I played it many years ago. I don't have my 65XE anymore but
i remember that flying around in a circle is the right way to do it.
Perhaps you should alter the landing direction or flight altitude.

Jacek Schneider s480@icslab.agh.edu.pl

2352. Re: 800 - MSDOS

Newsgroup: comp.sys.atari.8bit

To transfer data from Atari 8bit to PC, you can use the commercial hardware+programm kit from PPP of Germany (about DM 100). If you are interested mail me for more information.

```
Atari 8-bit wishlist

Looking for 1 each of the following games, cartridge or disk,
preferably with original docs, for the 800/XL/XE. Titles with a
"?" I need info about what they are. Thanks!

800/XL/XE - must have docs!
------------
Beamrider ?
Blue Max - need docs!
Burgertime
Choplifter
Creepy Corridors ?
Crossbow
Crossfire ?
Dark Crystal
Frogger II
Gateway to Apshai
Gemstone Warrior
Gyruss
Kangaroo
Legionnaire ?
Mario Bros.
Marble Madness
Montezuma's Revenge ?
Moonsweeper
Moon Patrol
Mousetrap (Atari) (Coleco?)
Mr. Do!
Necromancer
Pac-Man Jr.
Phantasie I-II ?
Pharoah's Revenge ?
Phoenix - arcade
Pitfall II
Pole Position II - does this exist?
Q*Bert's Qubes!
Rescue on Fractalus
Serpentine ?
Spindizzy
Star Raiders II - cart version
Thunderfox ?
Time Pilot
Tutankham (PB)
Vanguard
```

Venture - arcade (Atari?)
Wizard of Wor
Xevious

Also any Tolkien based graphic Adv/RP games.
Good Astronomy/Planetarium program for Atari 8-bit that is
updatable & takes full advantage of the Atari's capabilities.

Atari 2600 - must include original docs! No late releases!

Atlantis - need docs!
Basic Programming - with overlay(s).
China Syndrome ?
Dark Chambers
Dragonfire
Encounter at L-5
Exocet ?
Frogger
Frogger II
Montezuma's Revenge
Moonsweeper
Mousetrap (Atari)
Mousetrap (Coleco)
Mr. Do!
Pengo
Secret Quest
Smurf
SwordQuest: Waterworld
Solaris - need docs!
Stellar Track
Tunnel Runner
Yar's Revenge
Zoo Fun ?
Any good Adv/RP games for 2600.
I also need a pair of "keyboard controllers".

For sale or trade:

Atari 600XL (rust spots on RF shield) w/64K x 4 RAM chips. Board mods
not yet made. Five damaged joysticks, 2 RF cables, SIO cable, 1050 drive
(won't format), Wico trackball, & missile command cart. No PS's
$25, best offer, or trade.

Atari 5200 2-port with 2 working controllers, power supply, cables,
and 16 cartridges. Also 2600 adapter for 5200. System is in excellent
condition. Will take best offer. I would prefer to sell everything in
one bundle, but I'd consider splitting it.

Here are the 16 5200 carts. Please note a few are somewhat rare.
All except Frogger II, Pole Position, and Soccer have docs.

Pitfall II

Mario Bros.
Vanguard
Q*Bert
Gyruss
Frogger
Frogger II
Joust
Ms. Pac-Man
Kangaroo
Pac-Man
Qix
Congo Bongo
Popeye
Realsports Soccer
Pole Position

7800 cartridges w/box & docs for sale/trade.

Commando
Mat Mania
Touchdown Football
One-on-One Basketball
Hat Trick

2600 cartridges w/box & docs for sale/trade.

Dig Dug
Kangaroo
Jungle Hunt
Ms. Pac-Man
Phoenix
Realsports Football
Super Football
Space Invaders

I have the following BOXES in mint/near mint condition. Free to anyone
who wants them (Just pay shipping).

800/XL/XE

Ballblazer
Gauntlet
Ghostbusters
Final Legacy
Millipede

7800

Asteroids
Ballblazer
Centipede
Dark Chambers

Donkey Kong
Galaga
Ikari Warriors
Jinks
Joust
Pole Position II
RealSports Baseball
Robotron 2084
Scrapyard Dog
Super Huey

2600

Battlezone
Galaxian
Gravitar
Defender II

If anyone has anything to offer, a sale reference, or trade, please email!

I have the following computer books for sale, most are for the Atari 8-Bit line of computers.

Title; Author; Publisher; Description; Price

An Invitation to Programming 2:; Atari; SoftWare Manual for Writing Programs; .....$5.00 U.S.

Atari Basic; Bob Albrecht, LeRoy Finkel & Jerald R. Brown; John Wiley & Son Basic Reference/Minus front Cover; .....$3.00 U.S.

Atari Basic; Bob Albrecht, LeRoy Finkel & Jerald R. Brown; John Wiley & Son Basic Reference;.....$5.00 U.S.

Atari Basic Reference Guide; Atari; Quick Reference for Atari Basic.; .....$7.50 U.S.

Atari Microsoft Basic Instruction Manual; Atari; PhotoCopied and Bound Manual;.....$5.00 U.S.

Atari User's Guide; Mark Ellis, Robert Ellis & Larry Joel Goldstein; Brady Communicat Basic & Graphics for Atari 400/800/600XL/800XL/1200XL;..$5.00 U.S.

Basic Atari Basic; James S. Coan & Richard Kushner; Hayden Book Comp Atari Basic Book for the 400, 800 and the XL Computers;.....$5.00 U.S.

Bits, Bytes and Buzzwords; Mark Garetz; dilithium Press; Understanding Small Business Computers;.....$5.00 U.S.

COMPUTE!'S FIRST BOOK OF ATARI GRAPHICS; COMPUTE! Books; Games, Tutorials, Programs & Other Helpful Information!;.....$7.50 U.S.

Compute!'s Second Book of Atari;
Compute! Books;.....$7.50 U.S.

Compute!'s Third Book of Atari;
Compute! Books; Games, utilities,
tutorials, & other helpful info. XL
Compatible.....$7.50 U.S.

DOS 3; Atari; An Introduction to DOS 3;
.....$3.00 U.S.

Gemini-10X/15X Users Manual; Star
Micronics,; Manual for Gemini Printers;
.....$10.00 U.S.

HomePak; Russ Wetmore; Batteries Includ
Manual for HomePak;.....$5.00 U.S.

Inside Atari Basic; Bill Carris; Reston
Publishin A Fast, Fun and Friendly
Approach to the BASIC Language!;
.....$5.00 U.S.

Inside Atari DOS; COMPUTE! Books; DOS
2.0S Reference.;.....$5.00 U.S.

Introduction to Computers and Data
Processing Shelly & Cashman; Anaheim
Publishi Class Room Text Book, not
necessarily about Atari Computers;
.....$3.00 U.S.

Making it Count; Boeing Computer;
Student Manual/Introduction to
Computers & their Applications;
.....$3.00 U.S.

Mapping the Atari; Ian Chadwick;
COMPUTE! BOOKS; Comprehensive
sourcebook and memory guide for Atari
400/800;.....$7.50 U.S.

Music Construction Set; Will Harvey;
Electronic Arts; Just the Manual and
Reference Card;.....$5.00 U.S.

My First Alphabet; Atari; SoftWare
Reference;.....$3.00 U.S.

OS/A+; OSS; Manual for/Systems Software
for Apple and Atari Computers;
.....$5.00 U.S.

Paint; Alex Packer; Reston Publishin;
.....$3.00 U.S.

Program Design and Construction; David
A. Higgins; Prentice Hall In Book on
General Programming;.....$3.00 U.S.

The Home Accountant; Continental Soft
PhotoCopied and Bound Manual;
.....$5.00 U.S.

The Home Filing Manager Users Guide;
Atari; SoftWare Manual/Users Guide;
.....$5.00 U.S.

The Home Filing Manager Users Guide;
Atari; PhotoCopied and Bound Manual;
.....$3.00 U.S.

User's Handbook to the 400/800
Computers; Jeffrey R. Weber & Stephen
J. Sczcecinski; Weber System's I Atari
Handbook;.....$5.00 U.S.

Your Atari Computer; Lon Poole with
Martin McNiff & Steven Cook;
Osborne/McGraw-H Guide to Atari 400/800
Personal Computers/includes XL Series
Update;.....$5.00 U.S.

Have you ever wondered why none of your stuff sells here? Have you looked at the prices lately? Do you really think this stuff is hard to find and is worth $175.00 for a XF551, or maybe a 130XE really is worth $100, they barely got that when they were new.

Get a clue. I really get offended by you trying to rob people.

Hello,

I am considering writing an Atari 400/800 emulator for the Apple Mac.

I have already written a 6502 emulator (which mimics the BBC Micro and is called 'MacBeebEm').

I used to use the Atari 8 bitters alot when I was a teenager and programmed them with the help of the Technical Notes (big reference manuals) and De Re Atari.

If you can help this project by supplying ROM images of the OS and Basic, text files of the tech notes or just general advice, I would be very grateful.

Chris Lam,
Aston University,
U.K.

2359. Classic 8-bit conversions to new consoles

Yes, Archer Maclean did write the original Dropzone, although I've no idea whether or not he wrote the Ninetendo version(s). I saw a mini documentary type program on him a year or two ago, he lives in a huge house/mansion with swimming pool etc and a red Ferrari sat in the drive way! I think its safe to assume he had made quite a bit of cash from his programming skills! Apparently one of his most successful titles was Jimmy Whites Snooker, this was written for the Am**a and PCs (I think) and had a table level prospective. It really did look pretty good.

Another classic game available on the 8-bits, Pitfall, has also recently made it onto the consoles, (SNES I think, but it could be a Sega (Megadrive!)). There is a secret entrance, if you find this you will be able to play an exact replica of the original Atari 2600 version of the game, including the original blocky graphics and beeping sound effects. They say immitation is the best form of flattery. They did change the name a little, its now called Pitfall, The Myan Adventure - I hope I've spelled Myan right!
I have the 8-bit versions of Pitfall and Pitfall 2 however both are on cartridge, both work fine on an XL, (I don't want to sell them) and I've never seen them available on tape or disk.

Well, I had those games on tape (TURBO format - it took 40 secs to load)
and I could copy it onto DD with a copy program I had as well.

I want to transfer some of my old binary tape games to disk.
I have done this for a good portion of them, with most of the publicly
available transfer programs. However!!!! There are still some
boot tapes that I can't convert to disk because DOS takes up too
much memory. I am trying VERY HARD to get Protector2 from tape
to disk but nothing around can do it without crashing.

Anybody got a copy of the Cassette Operating System? or anything
that might work ... anything up at atari.archive?

Well, I might be able to help you. What kind of tape deck do you have?
If you have original by Atari and no TURBO, it's going to be hard but
when I had my XE, I used to have many tape copy programs which copied
tape-->disk, tape-->tape, disk-->tape in normal or TURBO.
If you won't find it anywhere else I can get it for you but it will take
2-3 weeks.

What is a good way to format Atari DOS 2.5-compatible disks (1050 density) in Ultraspeed format?

I'm reorganized all my binary games disks, and most need DOS 2.5 to work right, so I'm limited to 1050 density.

Ideas?

Rob

2367. Atari 800 computer equipment

I�d like to clear out all my Atari 8-bit stuff, just because I never use it anymore. I�d like to sell it as a package, but will break it up if I have to. Everything works perfectly unless specified otherwise.

Here�s what I have:

Atari 800 48K
Atari 800 48K that doesn�t work right. (I bought it for parts, but I think the only problem with it is in the memory cards)
Atari 800XL 64K
Commodore 1702 color monitor
ATR-8000 disk drive & printer interface w/64K buffer
Atari 810 disk drive
1 double density dumb drive (use w/ATR-8000)
1 double density dumb drive like above, w/broken door. Usable.
Joysticks
Paddles
Cables to hook all that stuff together
Bunch o� cartridges and diskettes with games & stuff

How about all this for $100.00 OBO? If you�re in the Dallas/Fort Worth area you can come by and pick it up, otherwise add shipping charges.

It must have been around 15 years ago that I saw a cartridge for
the Atari 800 called (I think) Video Art. It was immensely hip. What it
did was draw all these cool color graphics on the screen in realtime. You
could either control it with the joystick or just let it go.

That was a cool cartridge! Does anyone have one that they don't
want and would sell? I'm dying to get one!

You can e-mail me at the above address.

Thanks,
Owen

(A. Heller talks about transferfing boot tapes to disk.)
There could be a number of problems with making disk load files from
cassette boot tapes. BUT, if memory conflicts with DOS are the problem,
Have you tried one of the 'Menu Maker' programs that justs puts a small
loader in memory, no DOS, and then you boot and choose a letter from
the menu? You know what I'm talking about? The 'Menu Maker' program
just puts a very small loader program someplace low or non-conflicting
in memory. It is generally used to make a games disk with several games
that then load from a a, b, c, d, e choice menu.

410's had problemns with loading reliably that can be cured (or at least greatly reduced) by the replacement of a couple of transistors of 10% tolerance with ones of 1% tolerance. The resistors are r15 (240k, 1/2watt) and r14 (330k, 1/4 watt), part of the feedback loopof the two active filters. It is also reccomended to replace the other resistors in the filters (r10, r11, r12 and r13) in the same fashion.
But who cares? We all use Disk Drives these days anyhow, right?

And no, Atari is not now making PC Clones, but they once did! Made 2 models as I recall. Anyone got one of these abominations?

I got down my old collection of magazines last night and started thumbing through them and saw a lot of things I have NEVER seen. Being the curious type, I thought I would post a list to see if any of you have seen/used these goodies, tell me what you thought of them, were they junk or the real deal.
I'll limit myself to hardware items that I haven't seen mentioned on CSA8 as being in common use. Please forgive me if any of these are common and I should have seen one if I wasn't blind and stupid. Here goes;

Convox Voice master - Voice recognition module
the Ace 80 column cart
Midi Mate - Hybrid Arts (software for it was called Midi Tracker II)
the Plato Cartridge (the Learning Phone, remember?) by Atari
the ATR 8500 (not the famous ATR 8000) by SWP
the Rat - an 8-bit mouse, by Zobian-Controls
Persistant Ram Cart (?) by Intra-Tech Comp. Prod. , 16k & 32K
Stylewriter - Carolina Engineering Tech., a sort of Daisy Dot III HW interface! Worked with Epson compatables.
Joytyper detachable keyboard - Microtronics - for the 400
1 meg ramboard for the 800 - Eclipse (of top dos 1.5 fame?)
the Supra HD and interface for the PBI equiped XL's
the Supra Micronet - psuedo networking device
256 to 1 meg ramcarts - Canoe Computing (same as Magna ramcart? I would love to see one of these!)
ACS - Pacemark, allows multiple computers to use the same printer - NOT a switchbox, it acts as a spooler for all connected computers.)
810 Fast Chip - Binary Comp. Soft., a sort of US Doubler for the 810
Commander 2400 Detachable Keyboard - RCE
Voice Box & Voice Box II - Alien Group
EPROM BURNERS
Convologic Bytewriter
Duplicating Tech. Eprom Burner
Proburner - ?
My First Computer - ?, a keyboard and 8K for the 2600 VCS!!!!
Versawriter - Versaware, a graphics tablet.
Austin 80 col. board - 80 columns in RGB color for the 800!
XL/XE Boss II OS - Allen Macroware, replacement OS

There were others, maybe I'll do another list later.

I have Obtained SX212a.arc
I have it up and running now, and with this I can Now use My
kermit program for the atari to up/down load to/from my mainframe
this opens up a whole new world to my atari as I can now get
items from/to ftp sites.
Kermit though is only 40 columns, and as my mainframe, as Most I
would guess, is 80 columns, it make reading the screen hard to
say the least. I really want to get OMNICOM
up and running to combine the best of both worlds.
80 columns plus the Kermit upload/download protocol I crave.
HOWEVER, after getting the Omnicom.arc file from Umich
and unarcing it, I find it is MISSING a file????
omnicom.obj???
This file is not with the arc file. I need to be able
to attach my sx212a.arc file to it.....I believe the
sx212a.arc file turned into something like sx212.com
But it is a handler..I need to attach it to the omnicom.obj file
and run it, then run the omnicom.com program.
this sound right to anyone???
Any1 have the omnicom.obj, or know where I can get an UNMODIFIED
copy of it, Unless your using a SX212 atari direct-contact modem
A modified omnicom.obj file won't do me much good.
Thanks for any info you may have in helping me locate it.

Source record: 93442

```
HELP -HELP - HELP!
TURBO BASIC for the 800!
:
I am having problems accessing/using the TurboBasic program & docs
for the 800 that is in the Atari files library from Genie.
:
I downloaded the following files from the Atari library:
#5797 TR800A.ARC and #5798 TR800B.ARC.
Both files were received with no problems. Because they have an
.ARC extension I then deARCed both files with again no problems.
The results were TB14.DCM and TB14DOC.DCM.
I then used DSKCOM32.OBJ to again unCOMPACT them and I got one file
from TB14 that I guess is the TurboBasic program and a file that
contains the docs from TB14DOC.DCM. I am unable to read the docs since
they are not in text form. I tried to access them with a Atari Writer.
I also tried "Entering" them and "Loading" and "Running" them
(Of course I didn't expect that to do any good -
but I wanted to try it all). I also can't seem to get the TurboBasic
installed with or without a cartridge in place using the various
load / run / dos L / autorun.sys etc... I need help!

: newsgroup. These machines shouldn't be donated to such a slime ball,

Tim chokes on his Saturday morning coffee

So *he* is the one who was soliciting donations of equipment? I *am*
going to be ill.

I hope most of the people on c.s.a.8 are not this stupid, to either
donate equipment to this guy or buy the stuff. Nothing wrong with
donating equipment to a worthy cause, either to a school or to another
dirt-poor budding 8-bitter to get them into the world of 8-bit users,
but this? Bleah.

I'm going to go through his notes and point out where better deals can
be found...just in case anyone is considering buying any of the stuff.
(I speak mostly of lurkers; regular contributors wouldn't touch any of this
stuff, because of the asking price *and* the business practices.)

The COMPUTE! books at $7.50 each? HA!!! American Technavision is having
a 5-for-$15 sale, including the 1st and 3rd Books of Atari and the
2nd Book of Atari Graphics.

BASIC and Star Raiders for $5...with no documentation? You slay me.
Even *with* dox, these two carts--the equivalent of Combat and Pac-Man
in the 2600 world--are worth maybe two bucks. Again, American
Technavision has basic for $4 and Star Raiders for $2.50 (with dox, I
would assume).

I've accumulated maybe $250 worth of 8-bit stuff in the last month,
which includes:

One 800 XL, one 800 and one 400--the 800 and 800XL like new, with
all documentation for the 800;
Three 1050 disk drives with box and documentation for two;
Four 1010 program recorders;
One 1025 and one 1027 printer with all documentation;
Cables and power supplies for almost all of the above equipment;

about 50 software titles, all but a handful of cartridges with
box and documentation;
several books and magazines.

What would that cost me with the aforementioned ripoff?

Ouch. I hope P.T. Barnum wasn't right.

Just a thought...has anyone considered donating "marked" equipment--perhaps
with a distinguishing mark *inside* the equipment case--and then buying it
and seeing if you got your own equipment back? Try getting the part
about "donating to charity" in writing. Then if you got your own stuff
back, pursuing fraud charges with the relevant authorities?

If I had equipment, money and time to burn, I'd do it...

The RS232/joystick thing was probably me. There's two handlers that work with it, Jordan Chilcott's MDRIVE.COM & MPPHAYES.COM. Thing is, it's limited to 300 baud for using a modem or two way transfers via xmodem. If you want I can .UUE the files & send them to you.

I've got a ByteWriter, used. It only handles up to 27128s, though - a bit of a problem. It hooks in via joyports 1&2 or 3&4. ZIF socket. It also included an offer for a cart clone device, to make backups of your 8k or 16k carts.

Source record: 93430

I've seen the 80 column boards, pretty nice really, but they were way too expensive at the time they came out. I think they may have cost as much as a computer & disk drive. I have a Proburner, but loaned it out & it came back busted. Think I paid something like $150 for that. Idiot did not want anybody copying his design, so he potted the damm thing in epoxy! I got so PO'ed at the thing I slammed it down on a concrete floor. Nothing! They should have built the Space shuttle out of this stuff! It really only works great if you have a built in monitor anyway, like Omnimon. Other oddity of the thing was it had a 'run from EPROM' option: Everytime I tried this it fried the EPROM! Great engineering!
Canoe ram carts huh? <snicker>. Canoe was imfamous for announcing products then never delivering. I think they may have actually had a couple of products, but I can't remember a single thing they announced & actually delivered. IMHO: At least for something like SRAM, a ram cart makes some to no sense. For instance, if it's dynamic ram, just do like every other mod out there & put it under the hood or on the buss. For SRAM, that stuff's expensive! It's getting a little better now, something like the narrow .3" wide 128k SRAM goes for about $15. You could probably build a 256k cart yourself for $40-$50 in parts. I think Rambos still go for about $30+ the cost of the chips so it not a real bad idea. Problem is who's going to write software to support it?
Rick

2392. Game sought.. Dont recall title! HELP!

I'm looking for a game I played YEARS ago, when I was just a young whipper-snapper.

It was a graphical game with ghostly background music.. Most of the game, as I recall was spent wandering around a cemetary looking at the headstones of famous people. You could enter crypts and such, and be chased by skeletons.

I remember the graphics were fairly decent.

Another hint: Throughout the game, names were spelled using headstones or other objects..

Does this game ring any bells to anybody? I've been trying to find this game for about 10+ years now!

Message-ID: <3kfmo2$nkk@omni.voicenet.com>
Source record: 93434

Hi all,

Just broke my 800 and software out of the closet. I want to rescue my collection before all those SS/SD diskettes decay beyond repair. I've got a few questions/problems...

1) I only have 1 IO cable (computer to disk drive). I have 2 1050's and an 850, but have lost track of the other 2 cables. Where can I get more? Is this called a "SIO" cable, or does SIO refer to RS-232?

2) If I got a U.S. Doubler chip to make the drive SS/DD, can I use one of these PC programs I've read about to read the diskettes? Or do I need a true DS/DD drive? Have any of you done this with this configuration? What free Atari DOS's support these densities?

Thanks for any help.

ps Is "Necromancer" an awesome game or what?

2394. Game title sought! Please help!

Help! It's been10+ years since I've played
this game and dont recall its title. If it sounds familiar, please
contact me.

The game is situaed in a cemetary, and throughout the game you
can wander through crypts and listen to eery background
music/noise.

I also seem to remember it has the names oc celebrities blasted
throughout the background.

It was a graphical adventure.

Does this ring any bells?

Sorry about the terrible line noise

: going to be ill.

Yup, Ben Smith. Doesn't even participate in this newsgroup. He makes me
sick, so I am not suprised.

: I hope most of the people on c.s.a.8 are not this stupid, to either
: donate equipment to this guy or buy the stuff. Nothing wrong with

Exactly my point, I have nothing against this person making money, but at
these prices and the fact that he asked people to donate equipment to him
really ticked me off.

: I'm going to go through his notes and point out where better deals can
: be found...just in case anyone is considering buying any of the stuff.

He wants like 75 bucks for an 800XL with a 'special' power supply, that
power supply better be made out of gold in order to be having that
special price.

: (I speak mostly of lurkers; regular contributors wouldn't touch any of this
: stuff, because of the asking price *and* the business practices.)

Right. I wouldn't want to see a lurker buy this stuff (like on rec.games.
video.classic people are selling 7800 systems with 40 games when you can
buy them for $69, and they sell them for $120, I spoke up and got many
replies in e-mail for further information, I wouldn't have anything against
them if they sold it in pieces, but to try and sell it for twice as much
is insane) then that lurker would think the Atari 8-bit community is a
bunch of greedy slobs and probably wouldn't want to participate or hold
a grudge.

: The COMPUTE! books at $7.50 each? HA!!! American Technavision is having
: a 5-for-$15 sale, including the 1st and 3rd Books of Atari and the
: 2nd Book of Atari Graphics.

That's what I said, these books are not worth 5 and 8 bucks, they are not
even rare. I could see 8 bucks for De Re Atari, which I have only been
able to find one copy, or maybe 5 bucks for a service manual, but 5 bucks
for programming BASIC?

: BASIC and Star Raiders for $5...with no documentation? You slay me.
: Even *with* dox, these two carts--the equivalent of Combat and Pac-Man

Yeah, he is trying to sell software, which was probably donated, for 5 bucks
a whack, hell some of those games you can get from ftp sites, is he nuts?

And like you said, you can buy them from ATV, and Toad, and others.

: I've accumulated maybe $250 worth of 8-bit stuff in the last month,
: which includes:

I probably collected about 250 bucks worth of 8-bit stuff as well, gonna
do some hunting at garage sales. I really want to get some personal
software collections.

: What would that cost me with the aforementioned ripoff?

I bet alot, want to donate it? <laugh> Go ahead, make him drool, just
e-mail him. heheh.

: and seeing if you got your own equipment back? Try getting the part
: about "donating to charity" in writing. Then if you got your own stuff
: back, pursuing fraud charges with the relevant authorities?

Well he never said (I think) he was going to donate it to charity, he just
wants you to donate it to him so he can turn around and sell it for twice
as much as it is worth.

But then again, donate could mean (as far as legally goes) charity donation?

1) The plans for SIO2PC cable are at FTP: atari.archive.umich.edu
Within the ZIP file of the latest SIO2PC ZIP under the Sio2pc directory.
2) Dunno about mailing lists unless you mean to get comp.sys.atari.8bit
via e-mail.
3) Atari.archive.umich.edu is a "good" FTP site. It's the only one I ever
use (I can't be missing much, everything ends up there anyways!) Also,
other FTP sites are listed in the comp.sys.atari.8bit FAQ. Read it!
4) Single Density disks are difficult to read. Doesn't ANADISK claim to
do that or something??
5) Try using the "S" command in Gopher to save files. Anything that it
doesn't think is "PC Bin" will be viewed (including binary files which
have confusing (<cough>) extensions). I use "S" no matter what unless
it IS a text file and I DO want to view it.
Also, at least the one I use, Gopher also allows "D"ownload directly to
your machine using X/Y/Z-modem.

Good luck! (Read the FAQ! :))

2402. Re: ROT-13

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-19 03:02:02 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <pW8aePa.lmcclure@delphi.com>
Source record: 93441

In a message dated 3-16-95, Eyvind Bernhardsen replied to Earl Halliwell, saying:

"Try to ROT-13 a file twice. If you end up with the original text, it works."

I will admit to a bit of ignorance of Usenet and ask: Just what is ROT-13 encoding used for, anyway?

I noticed the other night that the editor in Delphi's newsreader has an option to encode/decode ROT-13.

Is it usable for sending binary files as ASCII text (like uuencode/decode), or is it simply an encryption method?

Regarding classic conversions...

There's a guy in the Mac community named Andrew Welch who runs a shareware software business called Ambrosia Software. Over the past few years he's come out with some OUTSTANDING modernized versions of classic video games (for the Mac, of course). His most recent is one called "Apeiron", a thoroughly modernized version of Centipede. He's also done versions of Asteroids (Maelstrom), Star Castle (Cyclone), and others, as well as a rather substantial collection of original software - all outstanding.

Just thought it was worth mentioning. :-)

2409. HyperIt! 0.5 released!

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-19 10:02:08 UTC
From: KENDRICK@sonoma.edu
Message-ID: <950319020200.20613cb2@sonoma.edu>
Source record: 93448

```
HYPERIT! 0.5 beta
-----------------

The following is a list of people who are on the HyperIt! beta
mailing list. If you want to be added or removed please e-mail me and let
me know. If you know someone who'd be interested in this program (a graphical,
"card"-based almost-language interface) have them e-mail me and I'll add them
to the update list.

wolf@grove.iup.edu ------------------- nameless
ftooned@delphi.com ------------------- Mike Hohman
bernard@link.xs4all.nl --------------- Bernard Kok
mcurrent@blue.weeg.uiowa.edu --------- Michael Current
krishna@primenet.com ----------------- Glenn Saunders
rick_michael_cortese@cup.portal.com -- Rick Cortese
bjcorr@delphi.com -------------------- Ben Corr
ethtbe@duna.ericsson.se -------------- Tamas Bene
tatar@student.uci.agh.edu.pl --------- Tomasz Tatar
bruck@brachot.jct.ac.il -------------- Itay Chamiel
ipoorten@cs.vu.nl -------------------- Ivo van Poorten
odaman@rocky.unoke.pfu.fujitsu.co.jp - Tetsuo Oda
mbitdc9306@newi.ac.uk ---------------- David Davies
jharris@cup.portal.com --------------- John Harris
d.paterson2@genie.geis.com ----------- David Paterson
rje@cs.nott.ac.uk -------------------- Raphael Espino

The ARC'd file of 0.5 beta is about 91K (bigger than a standard SD disk)
and unARC'd is about 154K.

It includes:
HyperIt! file selector ACTion! source and COMpiled executable
HyperIt! player ACTion! source and COMpiled executable
Dir2File ACTion! source and COMpiled executable
Stack Info TurboBASIC XL tokenized file
A few read-me doc files 38 column ATASCII text
Sample stack File-to-Dir'd directory
New Breed Software stack File-to-Dir'd directory
"Girls" stack File-to-Dir'd directory

Anyway, anyone else wanting a copy of 0.5 e-maile me (and tell me if you
want updates (to be added to the mailing list)).

Thanx!

-bill!

: Unfortunately, I still haven't gotten a solid enough answer on this question:

: Which is better for my purposes, an MIO or a Black Box?

: My Purposes: To run a reliable Atari 8-bit BBS with a hard drive and
: high-speed modem using (most likely) SpartaDOS-X and the BBS Express
: cartridge on an Atari 800XL w/256K RAM.

For a high speed modem, the BB is the only choice. The MIO is not
reliable at 14.4. There is some kind of replacement R: handler out for
the MIO but I can't vouch fori t.

For being able to partition swap (get beyond the 128 meg barrier) then I
think there is more software out for the MIO than the BB.

It sounds like the game you described was Telengard by Avalon Hill. It was written in Basic, I remember 'cause you could alter your stats to make it easier, pretty neat game. They also made Empire of the Overmind and Lords of Karma. Anybody remember the games by JVC such as Action Quest and Ghost Encounters? They were a couple of old favorites.

Fantastic! Having never seen an SIO2PC cable, I didn't even know it needed
any sort of "box" - would this procedure be at all hard, or would you,
now realising I'm absolutely no good with a soldering iron whatsoever,
recommend that I ask for one "ready-boxed" so to speak? :)

> 25 years since I visited England. I miss the good breakfast tea. An

This is a good place to look!

As long as the looking isn't directed at Ben Smith.

I've had no problem in the past when I've needed 8-bit parts and supplies
by posting the need right here in c.s.a.8. And the prices have generally
been very fair; in fact, I've bought a whole *system* (an 800, 1050,
1010, 1025, and a bunch of software, books and manuals) for what Ben Smith
wants for *one* *used* XF551 disk drive.

A lot of the people here have several systems and a lot of extra 8-bit
equipment. Some of them sell their stuff to others. On this newsgroup
you will occasionally see stuff for sale at very reasonable prices. Keep
looking around. Look for the sales. Make a request to buy and let the
offers roll in. Just do yourself a favor and don't assume you need to
pay Ben Smith prices for most of this stuff.

Quite often, you'll find that you can buy an 800 or 800XL for no more than
what it would cost to havew it fixed. I bought an 800XL from Goodwill for
$6 last month. There seems to be nothing wrong with it at all.

: HI

: Recently my drive completelly phreaked out and now it does not work at all
: and cannot be fixed :(

Why can't it be fixed? Do you know what's wrong with it? Is there a
problem with the drive mechanism? If so, you can get a replacement
mechanism from American Technavision for $14.95.

: So, I need a new one, my local store offers me one for 100$ (two sides,
: single density).
: Is it too much ? Should i get one from somewhere else (harware providers
: in FAQ for instance) ?

Well, I noticed you weren't in Portland...that sounded like a Ben Smith
price. Yes, it's too much. WAY too much. You can pick up a 1050 for
something like $40 or $50, usually. That seems to be the going rate
around here.

r > If you are sending a large file - please e-mail me for confirmation first

Howdy Richard

MyDOS marks a file as deleted (in the directory sectors) and sets all sectors
the file used as "free". That's why it takes so long, it has to go through
the whole file to find out which sectors belong to this file. (This system
has one big advantage over Sparta's system, you can shorten huge files by just
modifying sector links (and changing lenght and if necessary start sector).
With Sparta, all sectors have to come in 126 sector clusters followed by a
sector map.

If you overwrite a file (read: use an existing filename), MyDOS will put the
new file data in place of the other. If the new file is shorter then the
old one, you'll still have a (small) part of your old file on disk.

MyDOS does not fill sectors with zero's when deleting a file.

I can't conceive of an 8-bit Atari BBS actually requiring more than
128-MB of storage space. And if for some ungodly reason it does, I'll
probably just buy a Zip drive for the thing and forget about it. :-)

Hey, thanks for the info. My B&C catalog should be arriving soon,
which means that the newest 8-bit BBS will be coming out in the near
future. :-) Hey, is anyone else as siked about my BBS as I? :-)

2428. Cooltris 2 update this weekend isn't out yet! Sorry!

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-20 05:20:56 UTC
From: KENDRICK@sonoma.edu
Message-ID: <950319212050.2061248d@sonoma.edu>
Source record: 93366

With all the work I put into HyperIt! 0.5, helping dad put a bunch of
our old junk in storage (FINALLY) and spending much of my free time
with my girlfriend, I didn't get a chance to even TOUCH Cooltris 2.

But, I think I WILL compile and ARC up the current copy and post it
to comp.sys.atari.8bit UUencoded if I get a chance.

Nothing much has changed since the first trial release except the
menu kinda works now.

I hope others will follow me in the future by release some
Ultra-color'ed games of their own as unfortunately, ColorView modes
just eat up too much time and standard OS modes (even with DLIs) can
get kind of dull or hard to program for.

>but I also get 138, 140 and 143 errors as well. Heck, I have four 1010s;
>maybe I should just try another.

The fix I gave for the 410 just involves putting lower tolerance resistors
in the unit than Atari originally did (namely in the active filters). I
can't imagine why it would not help a 1010, if you know the correct
resistors to replace (I don't have 1010 schmatics, anyone else?)

>I've seen the 80 column boards, pretty nice really, but they were way too
>expensive at the time they came out. I think they may have cost as much
>as a computer & disk drive.

Looking at the advertised prices I'd have to agree. What are they going for
now I wonder?

>Canoe ram carts huh? <snicker>. Canoe was imfamous for announcing products
>then never delivering. I think they may have actually had a couple of
>products, but I can't remember a single thing they announced & actually
>delivered.

Do tell! Wonder how they stayed alive long enough to put out so many damned
ads? Were they and Magna related?

>IMHO: At least for something like SRAM, a ram cart makes some
>to no sense. For instance, if it's dynamic ram, just do like every other
>mod out there & put it under the hood or on the buss. For SRAM, that
stuff's
>expensive! It's getting a little better now, something like the narrow
>..3" wide 128k SRAM goes for about $15. You could probably build a 256k
>cart yourself for $40-$50 in parts. I think Rambos still go for about
>$30+ the cost of the chips so it not a real bad idea. Problem is who's
>going to write software to support it?
>Rick
How would you implement 1 meg of ram from cartridge? Oh, never mind, bank
switching similar to the ICD carts I imagine. Since I have never even heard
of anyone owning one of these I don't imagine there is a lot written for
them. Had no idea that Ramcarts were so expensive to build, that explains
why the idea never caught on. You haver to admit, it is the easiest memory
upgrade to install!

2439. Scott Adams adventures?

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-20 07:17:12 UTC
From: followel@ix.netcom.com
Message-ID: <3kja5o$61v@ixnews1.ix.netcom.com>
Source record: 93369

I'm a big fan of the original Scott Adams text adventures. A few years ago I had a copy of all 12 plus some of the graphics versions as well as the Stone of Sisyphus (sp?) and the Sorcerer of Claymorgue Castle. Alas, I must have lost them in a move because I can't find them anywhere. I had bought them from some PD company. I was told that they had been released into the public domain. I figure this must be true because a friend said he once saw a copy of the PC versions on a BBS somewhere (but didn't D/L !!) does anyone have any idea where I can get copies of these for my PC, Atari 8bit, or maybe a port for my ST (or better yet, all three!)? Any help would be GREATLY appreciated.

thanks in advance,
- Byron Followell

although I dont own a BB, I do own 3 MIO's, but would STILL have to
recommend the BlackBox.

You cant get support or parts for the MIO, you cant use 512byte hard
disks, you cant add-on a 1.44meg floppy drive, and finally Glenn S.
is correct, the MIO just sucks above 9600. Even 19.2k is a struggle
for the MIO.

The only pro for the MIO is it's ramdisk and printer buffer via RAM.

:
: I will admit to a bit of ignorance of Usenet and ask: Just what is ROT-13
: encoding used for, anyway?
: Is it usable for sending binary files as ASCII text (like uuencode/decode),
: or is it simply an encryption method?

ROT-13 encoding is a simple encrytion whichs just shifts the alphabet 13
along. This is so that you may post articles containing "spoiling" info eg
movie plots / sports results or "offensive" so people reading your
post can't read it by accident- they actually have to ROT-13 decode it.
Kind of like selling "adult" magazines in plastic wrappers.

It cannot be used for sending binary files as ASCII text

Hope this helps you

Trevor

(A. Heller talks some more about boot tape to disk file transfers.)
Andrew. You were specifically talking about transferring Protector II
to disk. I'm sure 'Protector II' is like many commercial tapes and is
probably a multi-stage boot, probably with some encryption and other
copy protection thrown in. It is no major problem to make a cassette
copoying program that will write to disk periodically and not fill up
some buffer and run out of memory. The problem is that the first stage
probably loads in its own 'loader' program and then there are multiple
stages to load after that.

TURBO was developed in Europe(Czechoslovakia) and widely used in eastern europe.
The regular Atari tape deck needed some cheap modification to support those
speeds and you needed a special loader(took about 10 secs). After you loaded
the loader, you could load any game/program(already saved in TURBO) and it
took only 20 secs to 1.5 mins to load depending on the size of the file. The
TURBO 2000 was 10 times faster than regular speed load time for tapes. But
there were also Turbo 4000 and 6000 (20 and 30 x faster respectively). I think
any other tape deck converted to be used with XL,XE computers could handle TURBO
without modification. I know for a fact that there are still hundreds of users
of XL,XE computers using TURBO today.

I've never seen a price on 80 column boards, either 'not for sale' or bundled with an 800 computer. There's always the Wooley 80 column mod he did in the SLCC Journal, but that involves a lot of solder. IMO: There well always be a problem with getting software for these things. All of them just take over the E: device vectors so stuff like basic or DOS menus work fine, but most of the custom stuff would fall flat on it's face. For instance, Express, Bobterm, SpeedScript, Textpro, & the recent 80 column term programs that people have been writting write directly to screen memory. The programs could be rewritten to take advantage of an 80 column boards, but I doubt if any of the authors would do it: EFFORT/EFFECT just to big.
Your right about the RAM cart thing, I'm taking to long to finish a board with a battery backed ram on it now<sigh>. Should have had the thing done 2 weeks ago. The Super carts just use a 74LS74 latch with the appropriate circuitry to do the bank switching. The logical choice would be to have a wider latch like a 74LS374 or '174 in there. I'm having trouble designing around everthing that's already there & didn't use a logical choice. Threw a whole PIA chip at the thing! I'm also only putting a 8k scram in there, now that makes no sense, but I had a couple of those<g>. I'm just running the upper address lines to the PIA & windowing the scram in a slice of the $D500 window. Actually, I haven't wire wrapped that !CS window yet. It would good to make it so the address could be selected, but I figure there will only be one made & I know where I could use it.

Hola mundo.

Lonnie McClure <lmcclure@delphi.com> wrote:
>I will admit to a bit of ignorance of Usenet and ask: Just what is ROT-13
>encoding used for, anyway?

rot-13 rotates the alphabet 13 places forward (or backward), so letters
are harder to read. If you think that a paragraph is ofensive to someone,
you can encode it using rot-13 and place a warning above it.

>Is it usable for sending binary files as ASCII text (like uuencode/decode),
>or is it simply an encryption method?

You cannot use it to send binary files, because only letters are translated
into other letters, and binary data remains the same and the file is still
binary.

I think that it cannot be called an "encryption" method, since you don't
need a password to decode it. It is just a "text hide" method. If
someone want to read your post, (s)he has to do extra job by (her)himself
, and if (s)he don't like what it says, it is not your fault because it
is NOT what you (really) wrote ;-)

2455. HyperIt! 0.5 beta mailing list

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-21 00:13:06 UTC
From: KENDRICK@sonoma.edu
Message-ID: <950320161257.20611a22@sonoma.edu>
Source record: 93397

Well, I've not yet had any replies to what I've mailed out lately
(beta 0.5 of HyperIt!) but I did check the ARC (after spending too much
time recombining and uudecoding the thing <sigh> Next time I'm NOT using
UUencode for MS-DOS!) and it works fine (even under PC Xformer 2.5!)

Here's who's on the list:

"Wolf" Mike Hohman Bernard Kok
Michael Current Glenn Saunders Rick Cortese
Ben Corr Tamas Bene Tomascz Tatar (sorry if I mispelled!)
Itay Chamiel Ivo van Poorten Tetsuo Oda
James King Jeff Potter Michael Snyder (right?)
Thomas Drake Victor Parada Joe Neil (guessing from the address)
Richard <someone> Cameron Tulley-Smith

If you're missing from the list I MAY have accidentally skipped you
when posting this, but to be sure, e-mail me. (If you've gotten v.0.5
you can be 99% sure you're on the list though).

If you don't WANT to be on this list, let me know. I've already killed
"Nagual69@aol.com" because my 4 letters to him each bounced back twice!
(Guess he dropped his account?)

If you want to be added, it's no problem. You'll get a copy of the current
version and you'll be added to this list. IF YOU JUST WANT THE LATEST
VERSION BUT DON'T WANT TO BE ADDED, BE SURE TO LET ME KNOW THAT, otherwise
you'll get updates until the final first release!

Of course all comments, questions, suggestions, bug reports, etc. are
happily accepted either via e-mail: kendrick@VAX.sonoma.edu or here on
comp.sys.atari.8bit (there are enough of you on my list that you may want
to converse about suggestions rather than a bunch of people all
giving me contradicting ideas and me having to explain why I comprimised! :))

To all those who HAVE gotten 0.5 beta, let me know what you think!
~~~~~~~~~~~~~~~~~~~~~~~~~~
And to folks who've tried making stacks, SEND THEM MY WAY! :)
Tetsuo Oda already started one (the copy I got is corrupt) and so did someone
else (sorry! I FORGOT WHO!.. the reason I remember Tetsuo's is
because I chat with Tetsuo more and had SOOO much trouble with his
file! :))

Anyway, enough useless babble. Hope to hear from you soon!

By using the XE memory, Miditrack III has enough sequence event capacity
to rival most standalone sequencer units. It supports a lot of features
which were new back then but which are standard these days for sequencers.

The ST version of Miditrack is almost identical featurewise, although it
has more memor capacity and a graphical diagram mode.

It's when you are limited to having the program AND the sequencer data
all confined in the 64K area that you wind up with some serious
compromises. But MTIII is quite capable.

2459. Robot War?

Newsgroup: comp.sys.atari.8bit

Now that I've reassembled my 8-bit, and I've been waxing nostalgic through old issues of CGW (during the 8-bit heyday circa 1982-84), I've been wondering about something.

Did Robot War ever get produced for the 8-bit?

Looking at the B&C public domain offerings, I see one game disk which has something called "Robot War" on it. Does anyone know if this is *the* Robot War?

I had this game for the Apple IIe (which I had after the 8-bit but don't even miss). In this game, you could program robots which would go to battle against each other. CGW did an annual Robot War tourneys many years ago, in fact. I remember making a pretty tough robot named Bastard (hey, I was only 20 then) which usually took out the other bots...

If this game was ever made for the 8-bit, I'd love to have it...does anyone know if it was? And if it was, does anyone know where I could find it?

As a user of Omniview for a long time I have to agree, however, Using Omni
in 80ciolumns was a joy. Much as I like Textpro, Letter Perfect always felt
like a better WP. If only it didn't use it's own funky DOS (making it
difficult to use with a HD) I'd still be using it and Data Perfect. Along
with 80 columns you got built in Ramdisk support for an Axlon 128K board,
the combination was pretty hard to beat! You're right, getting software
support for 80 columns is tough, but the right software package can
sometimes make it worth the investment. I REALLY wanted to try LP with an
Austin 80 Board on an RGB color monitor! I saw some screen shots that looked
incredable!

2464. Re: Classic 8-bit conversions to new consoles

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-21 07:29:35 UTC
From: kendrick@zippy.sonoma.EDU
Message-ID: <9503210730.AA29511@zippy.sonoma.EDU>
Source record: 93401

I've seen all of the programs you mentioned plus more.

You mentioned:

Apeiron - Centipede
Maelstrom - Asteroids
Cyclone - Star Castle

I've also seen:

Firefall - Centipede
Asterax - Asteroids (as well as the "Barney Blasters" hack)
Arashi - Tempest ("Live Wire" for us c.s.a.8'ers)
Patriot Cmd- Missile Cmd (also for the PC)

I'm actually often disappointed when I see a cool sounding game which, while loading, has an awesome introduction and/or title screen with killer music just to find "Oh jeez, just another Centipede game <sigh>"

But still, they seem to sell! :) (And keep the young ones interested in the GOOD games vs. Doom, Mortal Kombat, Street Fighter, etc. :))
(Or are these games only for old fogies (19 yr olds :)) like myself??)

I mean, look at Pitfall: Mayan Whatever and Tempest 2000 and I guess Drop Zone?
Oh, and Space Invaders (a crappy version) came out for the Game Boy not long ago either! :)

Why don't people just pay $25-50 for an 8-bit (obviously not from Benjamin Smith.. I mean seriously, $5 for a disk with something anyone with Usenet news-reading ability can get within a day at the most for >$0<!?!?) and get the old, real things! :)

2465. 1030 Express! compatibility? Please HELP!

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-21 09:27:43 UTC
From: John O'Dell <jodell@cts.com>
Message-ID: <Pine.SCO.3.91.950321005422.19911B-100000@crash.cts.com>
Source record: 93256

Although I imagine not many of you use 1030 Express! (Keith Ledbetter 10/85 (ver 2.0)) as your primary telecomm program, does anyone have experience in using it to download from shell accounts?

I have tried too many times to count to download the archiving utilities from umich and mirror sites (even Boston) without success. I feared that I had a hardware problem, but I am fairly certain now that there is some incompatibility between protocols (?) which is causing me problems with binary files in particular.

I am running an 800XL w/64K, 1050, and 1030. I set 1030 Express! to ATASCII for binary downloads and leave the parity on none (which is default). Is this correct? The results are consistent: nothing executes properly. UUDECODE.BAS will not even ENTER into RAM. I managed to capture it to disk and eventually ENTERed it that way, but when I tried to UUdecode SUPUNARC.UUE, I got an EOF error. SUPUNARC.COM, which I originally tried to download first (it seemed the quickest way to get to work unarc-ing icet.arc), never executed. Etc, etc, etc.

I tried YAU.COM recently, but I get the same type of error trying to uudecode SUPUNARC.UUE. All of these files at the ftp archives can't be corrupted, can they? I have used my 1030 to successfully up- and download files to/from a fellow Atari user across town many times. Therefore, I am fairly confident that the problem is with the protocol--is 1985 Xmodem protocol compatible with today's Xmodem?

Can anyone offer any advice? Meanwhile, I am using Ice-T ver 0.0 (thanks, M.C.!), so I am no longer as depressed as I was. But I would like to be able to download from ftp sites.

Please help!

John O'Dell jodell@cts.com Viva Atari!

PS Sorry about the failed posting attempt: I ctrl-Z'ed out of a vi editor. I didn't think it would be posted.

From: CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK
Message-ID: <6299230D5A@east-01.novell.leeds.ac.uk>
Source record: 93261

There are two versions of TURBO cassettes that I know of, one is a simple software fix the other involves fitting a hardware kit inside your data recorder.

1) The simple procedure involves a few pokes, sorry I can't remember where to simply speed up the baud rate for data transfer from 600 baud to somewhere above that. Beyond 900 baud it becomes VERY unreliable (can tapes get any more unreliable?). Anyway its hardly turbo, at best you can expect a 50% increase in speed, with increased unreliability.

2) The second method comes courtesy of the RAMBIT Turbo upgrade kit. Rambit is a company from the UK, they produce (note produce not produced as they are still going) several interesting upgrades and pieces of software, including a printer interface that connects via the PBI port and the above mention tape Turbo unit.
The Rambit Turbo Tape system requires you to fit a small module inside your data recorder and connect a few wires to places on the recorder's pcb. You then have a recorder that works the same as before but if it detects a turbo tape it kicks into action and loads at about 600% (yes 600%) of the original baud rate. A game that usually takes 15 minutes to load will load in about 1 minute! Now that is turbo. This modification cannot work on normal tapes, you have to convert them first and some software is provided (in Turbo format) to help you achieve this. This kit became quite popular in Eastern Europe a year or two ago and its still available. The current price is about ₧15 (UK pounds plus shipping), check out the vendor list for the address of Rambit.

I'm guessing you're referring to my FTP directory, as I just GnuZipped
all my files to save space. Most (hopefully) decent FTP servers will
allow you to specify the filename without the .gz extension, and then
they'll decompress the files prior to xferring them to you -- or at least
my FTP server will.

I've also seen a commercial Mac game called Sparx, which is just Qix.

I always thought the classic game movement would start by bringing back the classics and then move on to brand new, simple, fun games. But it doesn't seem to be happening.

There was a great exchange on the subject a few years ago in comp.sys.mac.games between Andrew Welch (who wrote Maestrom, a flashy Asteroids clone, and Ed Rotberg, who wrote a ton of classic Atari coin-ops including Blasteroids [paraphrased]:

Rotberg: Asteroids has been beaten to death, you should move on to something new.

Welch: But Maelstrom has fancier sound and 3-D looking rocks and lots of extras.

Rotberg: Blasteroids had all that back in 1987.

Announcing NEW Atari 8-bit software.....

From the programmers of Black Lamp, Tagalon and Crumbles Crisis
comes a game that Atari UK said they were going to release but
never did!

Under an exclusive deal, Richard Gore is pround to present;

```
TTTTT U U BBB EEEEE BBB AA DD DD IIIII EEEEE SSSSS
T U U B B E B B A A D D D D I E S
T U U BBB EEEE BBB AAAA D D D D I EEEE SSSSS
T U U B B E B B A A D D D D I E S
T UUUUU BBB EEEEE BBB A A DD DD IIIII EEEEE SSSSS
```

by IVAN MACKINTOSH and RICHARD MUNNS.

Tube Baddies is a strategic arcade game requiring accuracy, skill,
quick reactions and brain power, with top notch colourful graphics
and original music by Richard Munns.

Tube Baddies will officially be launched on April 15th 1995 at the
SAMS 2 computer show held in Stafford, England. However in order to
generate some pre-launch interest I am making this announcement now.
Tube Baddies is no longer a vapourware product, we are just adding a
few finishing touches to the disk and creating the manuals.

Tube Baddies will be priced at #4.95 (UK pounds including UK p&p),
or $10 (US dollars in cash) to customers in the USA. Other overseas
destinations please add #2 to cover p&p and remitt in pounds
sterling via an IMO or Bank draft. Tube Baddies is available on
disk only and requires a 64k XL/XE computer to run.

If you want to become one of the first people to own a copy of Tube
Baddies you may send your advance orders now with payment. The goods
will then be mailed as soon as possible after the 15th of April 1995.

For further details feel free to contact me, Richard GORE at

79 SPROTBROUGH ROAD, SPROTBROUGH, DONCASTER, DN5 8BW, ENGLAND

E-mail: chmrig@leeds.ac.uk

PS Also newly re-released, Black Lamp, a wonderful gothic platform,
arcade, adventure game. Atari UK did once release this game, but now
the author has regained his rights to the game and has made it
available on disk for the first time. Price #4.95 ($10).

I would think the 130XE mod is the correct one. The 65XEs I have are
just 130XEs with half the RAM and the mapper chip missing. Interestingly,
they also have the ECI fitted, which the US models apparently didn't.

Note that these machines are UK PAL models, so this may not apply to
the US versions.

: I originally tried to download first (it seemed the quickest way to get
: to work unarc-ing icet.arc), never executed. Etc, etc, etc.

Actually, if you are doing text transfers (Not sure how you would
initiate that on the Unix side other than "cat filename.ext") you would
want to receive in ASCII. (I would think.) Of course if you have
shell access, why not just "uudecode filename.exe" on the Unix side
and then "sx filename.ext" for XMODEM or "sb filename.ext" for ymodem.

Of course you must be aware that depending on how you are connected
to your shell account (as in, if you call a dailup line, then that
routes you to a terminal server, and then you log into your shell
account) there could be some problems since each one of those
nodes interprets data differently.

also..when FTP'ing always do a binary transfer to a unix account.
(okay..there are some times when you would want to do ascii...but..)

2477. does US doubler work with 800?

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-21 19:01:51 UTC
From: jamesp@agora.rdrop.com
Message-ID: <D5t0v4.LAE@agora.rdrop.com>
Source record: 93268

i am posting for a friend who doesant have internet access.

his older brother went off to college and left him his treasured
atari 800xl system. his brother says that the disk drive (a 1050)
has a us doubler chip installed in it. he also had a lot of
spartados disks which are written in some kinda 'sector skew'
format which i guess allows the us doubler to read or write them
very fast. so everything was fine until one day my friend spilled
a drink into the 800xl and it stopped working.

so he bought a original atari 800 computer to replace the 800xl.
all of his commercial game disks and atari dos stuff works just fine,
but none of the spartados stuff which takes advantage of the us doubler
works at all. it boots the first few sectors and then just dies.

does he need to buy a new 800xl? does the spartados and/or the us doubler thing
only work with 800xl? does anyone know why it would work just fine
with the 800xl but fail completely on the 800?
he is very sad to not be able to use any of the spartados stuff,
and any help would be greatly appreciated thanks!

james

: I want to upgrade its video so it can be used on a 1702 monitor - as
: right now, it has the video of a stock XL.

Well, decided to go for it, and installed the XE video upgrade in my
65xe. Will find out if it works in a couple hours (did that hack at work
and have to bring the 65xe back home to test).

Will post the results - maybe somebody else out there has interest in
upgrading their 65xe's video output.

Well, checked out the 65xe AC SuperVideo upgrade and it SORTA worked. I get fairly clean video, but sometimes upon powerup, I get a slightly greyish/black display.

Guess that goes to show that the 65xe isnt exactly 130xe compatible.

Or, you messed something up. I've done it before... nothing but
fear in the eyes booting up to a black screen after doing a mod.

If you actually followed the 130XE upgrade specs and found everything
I can't see why it wouldn't work unless they really are different.

WHOA! I just got my huge box of ATV stuff (Pac Man cart, F-15 Strike Eagle disk, 10 SIO cables (for $10 :)), Mapping the XL/XE and a Trak Ball).

I was just reading the XL stuff in Mapping and my GOD! I'm AMAZED!

An OS fine scrolling mode!?
The 764-internal keycode map is relocatable!? (And the 1200XL Func key Functions can be mapped to them!)
That TEMP gets 559 / 559 gets 0 / press a key / 559 gets temp thing which the 1200XL uses for Ctrl-F2) is a cool trick!
There's a "drive sector length" set of locations (default = 128, max size = 65535 .. how does THIS work, what uses it, and why is there only one register!?)
HELP has a latch flag!
The Internationl Character set has its own ChBase (for 1200XL Control+F4)

Man, I want Function keys again! :) I'D SERIOUSLY LIKE TO KNOW HOW TO GET A 1200XL KEYBOARD INSIDE (or on) AN 800XL!!!!!!!!!!

Also, does Ian Chadwick still have his CIS account!? >:^)

By using the XE memory, Miditrack III has enough sequence event capacity
>to rival most standalone sequencer units. It supports a lot of features
>which were new back then but which are standard these days for sequencers.

.........etc.

>It's when you are limited to having the program AND the sequencer data
>all confined in the 64K area that you wind up with some serious
>compromises. But MTIII is quite capable.

Will Miditrack support any of the current memory upgrades? You can bump an
8-bit to 4 meg these days.

> copoying program that will write to disk periodically and not fill up
> some buffer and run out of memory. The problem is that the first stage
> probably loads in its own 'loader' program and then there are multiple
> stages to load after that.

There is a program available that will supposedly copy just about any
multi-stage tape to a disk. I've got it and I make it's success rate
to be more like 80% - 90%. In short, it is pretty good. The only
problem with the program is that it is not entirely automatic in that
you have to remember how many stages are contained on the cassette
you wish to transfer.

The program is called Transdisk IV (obviously because it's version 4
of the program ;-) and is available from New Atari User magazine
(Page 6 publishing). I think that the asking price is ten pounds.

> any other tape deck converted to be used with XL,XE computers could handle TURBO
> without modification. I know for a fact that there are still hundreds of users
> of XL,XE computers using TURBO today.

There is another Turbo upgrade available in the UK sold by Rambit and
Micro Discount (I think they may also be sold by DGS as well ...??).
It was developed by Rambit back before the Atari started to become
popular in Eastern Europe.

I wonder if the Turbo 2000 sold in Eastern Europe was actually
developed there, or if it was a clone of Rambit's unit, since they
have a similar load speed increase?

I haven't actually got one of the Rambit units yet (it fits into the
1010 ... dunno about the other tape decks), but I intend to get one
sometime. Micro Discount (and presumeably DGS) create dual-format
cassettes of several of the titles they stock. On one side of the
tape sits the standard load version, while on the other side is ...
yup, you guessed it ... the turbo load version. Standard load tapes
will also work with tape decks fitted with this Turbo unit.

From: James King <jeking7@delphi.com>
Message-ID: <xQ+6GJ2.jeking7@delphi.com>
Source record: 93293

Are XFD and ATR images the same thing? Can you interchange SIO2PC and
XF25 images back and forth with one another?

I'm setting up a directory specifically for .ATR and .XFD images. I have
several 1meg SIO2PC images, completely loaded with SpartaDos, term programs
and just about everything else useful. It's a boot disk image.

I agree, Transdisk IV is *well* worth the asking price. But I disagree on having to remember the number of stages... if it's all on one side and you have enough memory, then you can just tell it nine stages (assuming there are <=9 stages) and read it all in. At the end it will error, but you just ignore that and write the file to disk anyway. Easy! You really need at least 128K for this though- the program is significantly less fiddly to use on my 130XE than the 800XL.

What the world needs is a new age.
What the world doesn't need is New Age.

Guys,

Silica Shop in the u.k. were still selling the 8-bit cart of River Raid until recently (also Miner 2049'er and a couple of others) for U.K.P 4.99 each.

I've no idea if they're still selling them.

Mark.

I don't know when the Rambit started with TURBO but people in eastern
Europe were using it since 1985/86. I had my tapedeck altered by a friend
in 1986 and there were already hundreds of users using TURBO.
If anyone is intrested and knows a little about soldering, I can get
the specs, loader and copy program(normal-->Turbo).
Even though TURBO 2000 is sorta the standard, the kit I used supported
up to TURBO 6000 (3xfaster).

2496. Tips for Transdisk IV

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-22 16:45:58 UTC
From: CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK
Message-ID: <7D2BD60E74@east-01.novell.leeds.ac.uk>
Source record: 93296

There has recently been talk of transferring tapes to disk via
Transdisk IV, this is a very good conversion tool when it works which
it does about 90% of the time. However you don't have to remember
how mant stages your tape loads in. Try this;

Select 'N' for non-standard tape load, even if it is a standard baud
rate tape and follow the prompts. Then provided you have enough
memory (128k is advisable and supported) the whole program will be
loaded into memory at once. The tape will only stop once it reaches
the very end or when you press break, however the data will remain
in memory. Then you should write the data to an 'XT' and 'XL/XE'
type disk (if you have the program you will know what I mean), if
one version doesn't work the other might!

I hope that helps somebody....

I spoke with Bob Klass this past weekend. He stated that wasn't ditching the 8-bit. He said that he told someone that he didn't have time to do a memory upgrade for the individual and then that person started a rumor that Bob Klass was going out of business to pursue the PC.

It ain't so.

Bob actually has some new things under development that should be out shortly for his hard drive controller. There is a new version of Pro! nearly complete. Bob should have a formal announcement on these items shortly.

No joke about decent tea. The big name in tea in the USA are Lipton, the moral equivalent to a McDonald's hamburger, & Red Rose which I believe is imported from Canada & is quite good. Some of the stuff we get in restaurants is quite vile: Nestea freeze dried with lemon flavoring. makes my hair stand on end just thinking about it!
I just finished a SIO2PC board for Richard Morris, only a month or two after I promised it<g> & I hit on another way of doing it. If it's OK with you, instead of putting a cable that plugs into your clone's serial port, what I'll do is make it so you can plug an IBM style modem cable into it. This'll save a couple of cents on the mailing & you'll end up being able to use any length serial cable you need. I've had a tendancy to only make the cables 3' or so long & it's sort of short for the real world.
About the box, it's just to keep the parts from shorting out or the leads from breaking. I don't want to mention names, but you can ask Bill Kendrick if he thinks it's necessary to build a box even after owning one for a year. I've got a few boxes around so I'll just put it in one.
Email me your address, I'm about 1/2 way through on the one I targeted for you so that means I should get it out in the next century<g>.

The options for utilizing the SD format disks on an 800 may not be that attractive, but it can be done. I believe SD 1.x can run on an 800, but you'd have to find the original distribution disks that came with the Sparta DOS construction set & boot that version to access the disks. Another method would be to get Oscar Fowler's program SR <Sparta Read> & use it to transfer the programs to an IBM, then use something like MyUtil to transfer them back onto a MyDOS formatted disk. I'm not sure if he would be willing to buy hardware just to pick the files off the disks, but if he would=> several more options.

I had a modification of DOS 2.5 called DOS 2.5+ which handled Ultraspeed disk
format. I used it with a Happy 1050 to kick it into hi speed mode. I don't
have a USDoubler but I think that it was designed to use it on one.

One item that I have which I have not seen mentioned lately is the MUPPET
KEYBOARD. These were put out by the Koala people and hook into the joystick.
The Atari/C-64 version had a disk with a C-64 game on one side and a driver on
the other side which made the keyboard work with any Atari program. The
driver works really well. My daughter used to use it with several programs
like Dr Suess games, Spinnaker games, etc.

From: ziggy29@rahul.net
Message-ID: <3kqj0o$n1@hustle.rahul.net>
Source record: 93316

As some of you may remember, I posted something about a sick 1050 a couple of weeks ago. I've done a complete 360 and now I'm back to square one.

When I first tried the drive then, the "busy" light turned off and on, at very regular intervals. Subsequent "fiddling" got it to work, albeit tenuously. At times, the drive was quite reliable. Later, it became unreliable again and started ruining disks that were put into it--even those which were write protected! (They could be fixed by reformatting with a good drive.)

After that, I immediately stopped using the drive. Today, I got a couple of replacement 1050 mechanisms from ATV and installed one of them (it was *incredibly* easy, btw). Now....turning on the drive causes the busy light to blink on and off again, in rhythmic patterns like before!

This is *really* weird. I think it's time to buy a new 1050. Anyone got an extra one, relatively cheap (i.e. $30-40ish), that you know works well? Unless, of course, you have a relatively cheap solution. This stoopid drive is giving me gray hair... :)

: My Problem is there is no Picture on my TV.
: Where can I get the layouts for the Atari 800 XL ?
: Or how knows the monitor cabel connections ?

The 800XL has a composite color monitor port and an RF interface for your
television. All you need to make your computer talk to your TV is to
visit your local Radio Shack and pick up an RF converter (typically sold
as a "game system hookup" or something like that) and a simply RCA-type
cable to run between 'em.
It sounds like you're trying to run the TV from your 800XL's monitor
port. Can't do that. Not unless your TV has a special "monitor" setting
(my old 10" TV did).

Someone please correct me if I am in error, but the entire XL seroes lacks
the Chroma output for split video, right? Now a Supervideo upgrade is nice,
but can't you simply get a chroma output from the emitter of Q7? Just run a
75 ohm resistor of the emitter and connect it up to the proprer place on the
monitor jack and away you go!

$.02 I believe the stock transfer rate of an Atari tape is approximately
600 baud. If there's a Turbo 4000 & 6000 I'm willing to bet that's
there maximum baud rate rather the the 20-30X figure. Still would
be up to 10 times faster, but there's a simple reason why you can't
go that fast. No cassette tape made will have a signal response that
will go to 19k. CERTAINLY not a modified 410 anyway. I used to own
a fair amount of audio stuff including Grundig <German> & Tandberg <Norway>
cassette decks which were pretty much top of the line at the time. My
graphics equalizer shows a spectrum & I've never seen an expensive
cassette deck go beyond about 12k with standard tape. There's just nothing
there! Flat! You don't even see static above 12k.

>and any help would be greatly appreciated thanks!
>
>james
Okay, if I'm off here guys, correct me. The only current Sparta Dos that
works with the 800 (not the first early version) is the Spart X cart and
is really only useful in a memory enhanced 800 (so it can use BANKED in the
config file and leave you some RAM.) I assume that the X cart can use Ultra
speed on a US Doubled 1050, but that's the only option, disk versions of
Sparta require an XL.
I know that the X cart will run on an 800, I do it.

Bill, about the sector thing, at least for my set up [ATR8000, 8bit] the computer supports at least out to 512 bytes/sector. I haven't really done a lot of looking around, like seeing if i can get the same results with an 800 OS as an XL, but I can pick an 180k IBM disk clean with my setup. I haven't really fooled around with it a lot, but I should be able to get it to read 360k & 720k disks. Apparently the only limit on sector size is the amount of ram in your drive. I've always set the buffer length & jumped straight through SIOV, never checked to see if the OS uses the sector length thing to update the SIO buffer lengths during the call.

At least from Portal anyway. Once there you open the compucat.html
Neal's been complaining about the traffic on Netcom as of late. He's
said something like it took him 2 days once just to get to his own
account. BTW: I've finally seen Compucat WWW with Netscape. It is
really nice. His wife Carolynn is an artist & she drew a bunch of
original pictures for the adventure. They used a color scanner to get
them into their WWW page. It's hard to believe he had this underground
adventure running on an 8 bit 10 years ago. It's been about 7 years
since I last wandered around the Laserbreath Caverns & it was kind of
fun to go there again.

>I have a simple question. Does anyone know if cartridges that work in an
>800 will also work in an 800xl?
And the answer is: It depends.

Most software is upwards compatible. Unfortunately, a few programs used non-standard calls to the Operating System. These die on an 800xl. The carts I know of that only run on 400/800 machines are:

Demon Attack, Krazy Kritters and Protector II.

Crossfire is irregular on xl/xe machines. Protector II is the game that originally sold me on the Atari; it was great to finally get it nine years after I got my 800.

Ben Corr <bjcorr@delphi.com> wrote:
: Someone please correct me if I am in error, but the entire XL seroes lacks
: the Chroma output for split video, right? Now a Supervideo upgrade is nice,

As far as I know, yes. The XE is lacking it as well, but the 800 did have
a chroma output, or it is atleast in the schematics that way.

: but can't you simply get a chroma output from the emitter of Q7? Just run a
: 75 ohm resistor of the emitter and connect it up to the proprer place on the
: monitor jack and away you go!

SuperVideo is an improvement to the video circuit, reduces some of the
distorting, but as far as I can tell for the minimum chroma output is
(looking at the SV schematic) from the emitter of Q5 and it has a
100 ohm resistor. But if your going that far you might as well as go
all the way. :)

I have been doing some work on my 600XL, among them a monitor output. The 600XL has the traces for a monitor cable, it just lacks the components.

I have also noticed another vacant area of traces on the motherboard below and to the left of the monitor cable traces. Among other missing components there is a vacant spot for a 14 pin IC (U24.) Would anyone happen to know the purpose of these missing components?

Rick Cortese said: "I don't want to mention names, but you can ask Bill Kendrick"

HOW >DARE< YOU MENTION ME!?!?! >:^(

Just kidding! :)

I used SIO2PC for quite a while until my 1200XL broke (I thought it was the cable so I sent it back to Rick to see if he could test it and fix it.. it wasn't broken)

Anyway, when I first had it, it was lose (glue all over the breadboard :)) and I eventually screwed it onto a large piece of wood to hold it down.

Now I've got a box, but still, the damned thing is too light and sometimes my heavy thick 25-pin RS232 cable and it's connector throw the poor thing around, but at least now that it's in the box I'm not worried as much about murdering the thing.

: of the net and lack of netiquette!

Hey, James...forget that e-mail I just sent you about the 1050. I can buy one from Ben Smith for $75! :)

Seriously, though...yes. And the prices are atrocious. Since I've never seen Ben Smith participate in c.s.a.8 except for these ads, they're obviously just "drive-by" postings.

If people want to sell a few extra pieces of 8-bit equipment, and they contribute to the discussion and aren't out to rip people off--as Mr. Smith seems intent on doing--fine. I think it's good to keep market for 8-bit products at realistic prices. What sucks is the blatant commercialism of Ben Smith's efforts.

Most of us have probably just accumulated a little extra equipment that we don't need. Or maybe we wanted a few pieces of software/hardware in a "package deal" system that was too good to pass up. Either way, there isn't gross profiteering, and a spirit of cooperation that otherwise exists in the group. (When there is very little mainstream support left, concerned users need to band together and all that...)

But $175 for an XF551? $5 for a BASIC cart with no manuals? $10 for books which ATV has for $3 each (when you buy 5)? Sheesh. Apparently someone hasn't priced the market.

I'm about 99% sure that the last STart (and thus the last Antic) was the February/March 1991 issue. I'm not sure about the last issue as a stand-alone magazine. They list that you could buy the entire library of Antic magazines ('83 to '89) for $129.95 + shipping.

Source record: 93336

(Ryan Osborn says last STart(with Antic in it) was 2-3/91.)
That's interesting. '83 to '89 Antic complete for $129.95.
Here's what I've found out.
Antic:
1st issue 4/82 (Vol. 1, Issue 1)
Was bi-monthly to start until 2-3/83 (vol 1, issue 6) then went
monthly 4/83 (Vol 2, issue 1). Antic then went to June/July 1990 as a
separate magazine. There were no Antics for 8,9 of 90. Then Antic was
put into STart for 10,11,12 of 90 and 1/91. Then STart went bi-monthly
(with Antic in it) 2-3/91 and 4-5/91. 4-5/91 was the last issue of
STart (with Antic in it). So I guess you could say Antic started 2-3/83
and ended 4-5/91.
ANALOG:
ANALOG started issue #1 1-2/81 and was supposed to be bi-monthly.
It missed issues so that it wound up with #12 being 7-8/83. It then
went pretty steady, one issue per month, until #59 (11/88). There was a
(Oooops that was issue #58 10/88). There was a six month gap when
Deschenes left, Papas became sole editor/publisher and LFP bought
ANALOG. ANALOG then went pretty steady to issue #79 (12/89) and 'sold
out' to Antic, the remaining subscriptions being 'traded in'
automatically for Antics. So ANALOG went from issue #1 1/81 to issue
#79 12/89.
By the way, I've previously said LFP changed the permissions to pass
around ANALOG programs. I don't think he really did, but I don't want
to start a debate.

Atari 8-bit wishlist
(sale/trade after list)

Looking for the following games, cartridge or disk, (pref. cart)
with original docs, for the 800/XL/XE. Titles with a "?" I need
info about what they are. Thanks!

800/XL/XE - must include docs!
---------------------------------------
BC Quest for Tires
Beamrider
Blue Max - only need docs!
Burgertime
Choplifter
Creepy Corridors ?
Crossbow
Crossfire
Dark Crystal
Encounter ?
Frogger II
Gemstone Warrior
Gyruss
Kangaroo
Karateka
Legionnaire ?
Mario Bros.
Marble Madness
Montezuma's Revenge
Moonsweeper
Moon Patrol
Mousetrap (Atari?)
Mr. Do!
Phantasie I-II ?
Pharoah's Revenge ?
Phoenix - arcade
Pitfall II
Pole Position II - does this exist?
Q*Bert's Qubes!
Serpentine
Star Raiders II - cartridge version
Temple of Apshai
Thunderfox ?
Time Pilot
Tower Toppler
Tutankham (PB cart)
```

Turmoil ?
Venture - arcade (Atari?)
Zenji ?

Also any Tolkien based graphic Adv/RP games.
Good Astronomy/Planetarium program for Atari 8-bit that is
updatable & takes full advantage of the Atari's abilities.

Atari 2600 - must include original docs!
- no late release (85-90) classic 1978-84 carts!
- picture labels much preferred.

Basic Programming - with overlay(s)
China Syndrome ?
Crazy Climber (someday...)
Crossbow
Dark Chambers
Dragonfire
Encounter at L-5
Exocet ?
Frogger
Frogger II
Kick Man ?
Montezuma's Revenge
Moonsweeper
Mousetrap (Atari - difference from Coleco?)
Mousetrap (Coleco)
Mr. Do!
Pengo
Pitfall!
Pole Position
Raiders of the Lost Ark
Secret Quest
Skiing
Smurf Rescue
Sorcerer's Apprentice
Space Shuttle
Star Voyager ?
SwordQuest: Waterworld
Stellar Track
Tunnel Runner
Yar's Revenge
Zoo Fun ?

Only need docs for these 2600 carts:
Atlantis
Berserk
Defender
E.T.
Jr. Pac-Man
Krull

Solaris

I also need a pair of 2600 "keyboard controllers".

Atari 7800 - must include docs!

Food Fight
Karateka
Planet Smashers ?

Items for sale or trade:

Atari 600XL (rust spots on RF shield) w/64K RAM chips. Board mods not yet made. Five damaged joysticks, 2 RF cables, SIO cable, 1050 drive (won't format), Wico trackball, & missile command cart. No PS's
$25 for all, best offer, or trade.

Atari 5200 2-port with 2 working controllers, power supply, cables, and 16 cartridges. System is in excellent condition. Will take best offer. I would prefer to sell everything together, but I'd consider splitting it.

Asking price guide:
$4 x 15 carts = $60
Plus Frogger II $10
Complete 5200 system $20
Total only $90

2600 adapter for 5200 $25 obo

Here are the 16 5200 carts. Please note a few are somewhat rare. All except Frogger II, Pole Position, and Soccer have original docs. Frogger II has photocopied docs.

Pitfall II
Mario Bros.
Vanguard
Q*Bert
Gyruss
Frogger
Frogger II
Joust
Ms. Pac-Man
Kangaroo
Pac-Man
Qix
Congo Bongo
Popeye
Realsports Soccer - worn label
Pole Position - worn label

7800 cartridges w/box & docs for sale/trade.

Commando
Mat Mania
Touchdown Football
One-on-One Basketball
Hat Trick

2600 cartridges w/box & docs for sale/trade.

Dig Dug
Galaxian - no docs
Jungle Hunt
Kangaroo
Ms. Pac-Man
Phoenix
Realsports Football
Super Football
Space Invaders

I have the following BOXES in mint/near mint condition. Free
to anyone who wants them. (Just pay shipping. Or will trade
for a cart or two).

800/XL/XE Boxes

Ballblazer
Gauntlet
Ghostbusters
Final Legacy
Food Fight
Millipede

7800 Boxes

Asteroids
Ballblazer
Centipede
Dark Chambers
Desert Falcon
Donkey Kong
Donkey Kong Jr.
Galaga
Ikari Warriors
Jinks
Joust
Pole Position II
RealSports Baseball
Robotron 2084
Scrapyard Dog
Super Huey

2600 Boxes

Battlezone
Gravitar
Defender II

If anyone has anything above to sell, trade, or knows of a
sale, closeout, etc., please email. Thanks!

richczeta@aol.com

Well, sounds like a PCB problemn. I would suspect the floopy drive
controller chip, those go for about $20 from B&C, an expensive guess, anyone
else more knowledgable have a clue?

Don't throw the drive away! If you get a new one and have no interest send
the old one to me (minus the new drive mech) I'll pay for postage! I like
to tinker with things....

That is something I hadn't thought of, you may have an IC that needs
reseating (slapping the drive does that, sort of. Remember the first ST's
that shipped had a similar problemn, because Atari in their infinite wisdom
used cheap sockets that only contacted the chips on one side of the prong?
Their advised fix was to drop the computer from a few inches onto the desk,
to reseat the chips? What a joke!) Just pry the chips on the PCB up a little
and shove'em back in, see if that helps.

Rick_Michael_Cortese@cup.portal.com wrote:
: $.02 I believe the stock transfer rate of an Atari tape is approximately
: 600 baud. If there's a Turbo 4000 & 6000 I'm willing to bet that's
: there maximum baud rate rather the the 20-30X figure. Still would
: be up to 10 times faster, but there's a simple reason why you can't
: go that fast. No cassette tape made will have a signal response that
: will go to 19k. CERTAINLY not a modified 410 anyway. I used to own
: a fair amount of audio stuff including Grundig <German> & Tandberg <Norway>
: cassette decks which were pretty much top of the line at the time. My
: graphics equalizer shows a spectrum & I've never seen an expensive
: cassette deck go beyond about 12k with standard tape. There's just nothing
: there! Flat! You don't even see static above 12k.
: Rick

There were many TURBO standards developed in Poland too.
Those systems never used speed beyond 9600 boods. I have written software for
ATARI TURBO ROM and i know that going faster than 12000 boods would be impossible
because the tape speed is too unstable and i would be too difficult to measure
impuls length properly. No way! 30 times faster probably means only total loading
time (games were loaded in one big block in those systems i know).

PS. I spend some time looking at the reasons of tape errors in standard transmission.
Probably ATARI screwed up the tape OS. Part of OS wchich measured the tape
speed was over-reacting leading to unexpected errors. That is the main
reason why TURBO was much more relyiable.

ebgevza@oak.grove.iup.edu () wrote:

E> I have obtained SX212a.arc

The SX212 is a modem. You are talking about a program to load the
modem "R:" device handler, are you not ? (just want to be sure....)

E> I have it up and running now, and with this I can now use my
E> Kermit program for the Atari to up/down load to/from my mainframe.
E> This opens up a whole new world to my Atari, as I can now get
E> items from/to FTP sites.

Kermit does not support an FTP protocol interface. Kermit will allow
you to perform file transfers from your mainframe to your ATARI 8-bit, but
it will not support FTP transfers that require TCP/IP protocols. You
--CAN-- FTP to and from your mainframe, but then you must --DOWNLOAD-- from
your mainframe to your ATARI 8-bit.

E> Kermit though is only 40 columns, and as my mainframe (as most I
E> would guess) is 80 columns, it makes reading the screen hard, to
E> say the least.

Umm... KERMIT-65 supports both 40 columns and 80-columns. It is only
ACTION!-KERMIT-11 that supports 40-columns only. ACTION!-KERMIT does
provide an interface that looks a little like the FTP program. Perhaps
this is creating some confusion? I am using the KERMIT-65 program in
80-columns with an AMDEK COLOR-1 monitor right now as we speak. To turn on
80-column mode, all that I had to do was type:

KERMIT-65> SET TERMINAL-EMULATION VT100
KERMIT-65> SET SCREEN-DRIVER 80-COLUMNS

(NOTE: If you get the MAC65 source code from the Archive, you will see
that the VT52 emulation hadn't fully been implemented. Evidently work on
VT100 emulation was finished, but work on the VT52 emulation was never
completed (i.e. several of the VT52 codes are missing, probably as a space
saving measure). Therefore, always use VT100 emulation or no emulation
when you are in 80-column mode, but VT52 emulation will not be completely
accurate.)

E> I really want to get OMNICOM up and running to combine the best of both
E> worlds. 80-columns plus the Kermit upload/download protocol I crave.

What myself and many other users do is to use an 80-column term
program to FTP and GOPHER and LYNX files (such as KERMIT-65, FLICKERTERM,
or ICE-T), then switch into a terminal program such as BOBTERM to do the

actual file transfers. There is an excellent 80-column terminal program written specifically for the SX212 modem called "TERM80". The reason that you don't see it mentioned often is because it --ONLY-- will run with an SX212 modem, and therefore all Atarians can't use it.

E> HOWEVER, after getting the Omnicom.arc file from Umich
E> and unarcing it, I find it is MISSING a file????
E> omnicom.obj???

E> but it is a handler.... I need to attach it to the omnicom.obj
E> file and run it, then run the omnicom.com program.
E> This sound right to anyone???

A word about the ".COM" extender. The ATARI ".COM" extenders are not the same as an MS-DOS ".COM" extender. The ATARI ".COM" extenders are a designation for a particular ATARI DOS, called "SpartaDOS", to let this DOS know that you have an executible binary "COMMAND" that needs to be run. Users of SpartaDOS need this extender on their binary images. Most Atarians who create compiled executible object files such as ".OBJ" and ".EXE" have given up long ago trying to talk to SpartaDOS users and have silently acquiesced to simply naming all of their executible binary images with a ".COM" extender. OMNICOM.OBJ and OMNICOM.COM both refer to the --SAME-- program, i.e. OMNICOM. The life of the OMNICOM program spans the popular acceptance of SpartaDOS as a major ATARI DOS. The binary code was first called OMNICOM.OBJ, so this is what is probably mentioned in the documentation. When the extra file transfer protocols were later added to an update of the program, the file was renamed as OMNICOM.COM so as to not upset the SpartaDOS users. OMNICOM.OBJ and OMNICOM.COM are the same program, namely OMNICOM. Therefore, you need to --APPEND-- a --COPY-- of OMNICOM.COM onto --THE END OF-- your SX212 modem handler, e.g. the handler comes at the top, the program follows after, the file is a --COMPOUND-- file composed of --TWO-- pieces of binary code appended together. (Be sure to use --COPIES-- of both the SX212 handler/loader and OMNICOM. You can name the compound program image something like "RUNIT" or "DOIT" or "DIALUP" for a start, until you can fully test it.)

E> Anyone have the omnicom.obj, or know where I can get an UNMODIFIED
E> copy of it?

You want the OMNICOM.COM file! This is the lastest, most up-to-date version of OMNICOM. OMNICOM.OBJ doesn't contain the XMODEM-CRC file transfer protocol.

E> Unless you're using a SX212 Atari direct-connect modem,
E> a modified omnicom.obj file won't do me much good.
E> Thanks for any info you may have in helping me locate it.
E> ---DISK DOCTOR!!!

Try TERM80, instead. That program was written specifically for the ATARI SX212 modem and has the SX212 modem handler built into it (which makes it useless if you don't own an SX212, though). I use KERMIT-65 for my terminal program, but I don't use it for file transferring, since it uses no RAM buffering and thrashes my disk drive. Good Luck!

2564. More details on Tube Baddies, as requested!

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-24 14:22:33 UTC
From: CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK

Source record: 93168

Right then, heres some more details on the new game Tube Baddies as requested;

It is sort of a strategic, action arcade game, quite hard to explain but great fun to play. Basically there are some pipes, that are slowly corroding. Out of these holes come the Tube Baddies, it is your job to patch up all the holes in the pipes and collect the Tube Baddies. You are armed with a stun gun, so you can't kill the Tube baddies, you have to stun them and then shoot them again, the second shot will send them off in the direction of the shot. When the Tube Baddies reach the edge of the screen they just bounce back. At the bottom of the screen is a bucket, you must guide the Tube Baddies into this bucket. Touching the Tube Baddies is not healthy and scattered around the screen are objects like bubble gum (slow you down), electric cables (dangerous to your health) etc. I can promise you, you won't feel let down by the graphics or sounds, they are all top class, well upto commercial standards.

Unfortunately there will not be a demo version or any screen shots uploaded to any BBS, software archive etc. I realise I am asking people to buy on trust when they have no idea what the game is about. Should I send a copy to AC and/or Current Notes for review purposes?

GS> defacto standard.

Huh? MYDOS lacks NOTE and POINT ? Then what was all the fuss about
MYDOS 4.53 supporting a three byte NOTE and POINT ? Of course MYDOS has
NOTE and POINT! I think you should clear up this point before it creates
some confusion (mainly, that SpartaDOS does it differently, i.e. relative
offsets versus absolute file SEEKs). Unless you are using a serial device
such as a tape drive or datasette, you'd --BETTER-- be able to provide
random access to file sectors. Otherwise, there is something terribly wrong
with the heads of your disk drive if they can only move serially! ;-)

LB> Please tell me what I gotta do!

TB14, a.k.a. TURBO BASIC version 1.4 is a program designed for the
ATARI 800XL/XE line of computers. What you need is a file called "FrOst
BASIC" or TB32Q.ARC . When you undiscomm this version of BASIC, all that
you will see is a DOS.SYS file, without any DUP.SYS file, on a single disk.
Take heart! ...as this DOS.SYS file is actually the FrOst or TURBO BASIC
file masquerading as a DOS file. It will load by itself and it will handle
most DOS functions as well. TB14 is "regular" TURBO BASIC, and it will not
run on an vanilla 48K ATARI 800 as it needs the extra RAM bank under the
OS. FrOst BASIC and the version of TURBO BASIC patched for SpartaDOS do
not have this same limitation.

The cartridge version of "Story Machine" also fails to run on a XL/XE machine.

If you have access to either a SDX or a Diamond cartridge it is possible to run the 800 only game cartridges on an XL/XE machine. I have done it.

Place the game on the top of the SDX or Diamond cart. Then boot up with the translator. Then go to cartridge, and it's like running on an 800.

I wouldn't think transporting a file from cassette to disk would be particularly difficult; there's a little bit of binary-load-header reworking required at the beginning, and from that point on you ought to be able to use a reasonable buffering scheme... I did the reverse conversion, disk-to-tape, myself, on the 800, including support for "multi-segment" load-'n'-go files that didn't load contiguously into memory, 'way back in '83 or so... I could probably write the cassette-to-disk program, too, in fifteen minutes -- if I HAD fifteen minutes and a working Atari cassette drive (mine runs but the tapes won't load: I suspect either an alignment or speed problem, or both. Anybody here have any suggestions, or should I just run it across town to bob Puff? :-) I've also always thought it would be cool to build an adapter circuit that would let me save/load Atari "cassette" programs to/from "any" tape deck. Imagine my big ol' TEAC 7" reel-to-reel feeding Pac-Man into my 800XL... :-))...

I'm not entirely sure when Rambit started theirs. Since I've owned an
Atari 8-bit since 1985, my mags only go that far back but I'm pretty
sure I've seen an advert from them in one of my oldest mags.

Im over at a friends house and hes got an enormous collection of Atari 8 bit and ST hardware and books to get rid of. Included are:

Atari 800XL
2 Atari 1050 Drives (Happy Enhanced)
NEC Color Monitor
Joysticks
200 or so diskettes (some originals, others ???)
Approx 15 original boxed games and OS software (SSI, Mac65, etc)
Atari 1050 Field Service Manual
MC68000 Users Manual (400 pages)
86 Assembler
6502 Assembler
Mapping the Atari
Atari XL Users Handbook
COmputes Atari Graphics #1, #2
Computes 2nd and 3rd book
Assembly Lang Book
Software Codebreaking for Atari

Plus about 20 other xeroxed books and publications (thousands of pages) on hardware, mag exerps, etc.

Hes looking for $150 plus shipping (this stuff probably weighs 75 pounds or more).

Email miked@innet.com with responses.

Thanks!

I'm looking for the following items, but can only trade for them - as I'm
kinda broke for the next 3 or so months:

1) Atari 810 disk drive with Happy upgrade
2) Star Nx1000 NLQ 9pin printer
3) 512k ram upgraded 800xl
4) Crypt of the Undead game and others by same developer
5) Black Box by CSS
6) 256byte SCSI hard disk (20meg and up)
7) Adaptec 4000a/4070 (MOST URGENTLY NEEDED)

I have the following potential trade items:

1) Atari 1050 SD/ED disk drives (x 4)
2) Indus GT SS/DD disk drive
3) Atari 65xe w/SuperVideo and Audio and socketed ROM
4) Stock 600xl
5) 410 cassette recorder with custom dust cover
6) 850 serial/parallel interface
7) MPI printer interfaces (x 2)
8) Atari 835(?) Acoustic coupler modems (x 3)
9) Atari 130xe (stock) with yellowed keys (rest VERY clean)
10) Atari 2600 console
11) Atari 800xl (stock) competely socketed w/SuperVideo, Audio

Item 9003768 95/03/22 19:46

From: J.C.MORDOSKY Jonathan C. Mordosky

To: B.POEHLAND Benjamin L. Poehland

Sub: March 26, NEAR*US Meeting

NEAR*US Committee Meeting
March 26, 1995 @ 12:00 noon
Penn Station, Newark, New Jersey

March 21, 1995

Hi,

I would personally like to thank everyone involved with NEAR*US.
It is evident from the level of enthusiasm and all the positive
feedback, NEAR*US has the support of the Atari community. It is now
up to us, to mold NEAR*US into a useful and productive organization.
There has been much discussion of what we need to do. The time has
come to set the path, choose the goals, and continue the journey of
NEAR*US.

Please take a few minutes and jot down thoughts on NEAR*US.
Please think about and list the needs that you and/or your group feel
that NEAR*US should address. Any and all suggestions are welcome.

The organizational committee formed at the March 11th meeting
will meet this Sunday, March 26, 1995. If any representatives from
other Atari user groups wish to attend, they are welcome. Please let
us know of your intentions.

We would like to thank Joseph E. Hicswa, president of the Jersey
Atari Computer Group for picking this meeting location. It is often
difficult to find a suitable location on such short notice. Joe has
assured us that it is easy to find and will meet our needs.

We will be getting together at Penn Station also known as the
Newark Rail Road Station located in Newark, New Jersey. Penn Station
has been a landmark in Newark for many, many years and is well known
locally. There are several rail road stations in the north east also
called Penn Station, this one is located in Newark, New Jersey.

Unfortunately, we do not have detailed directions from each of
the many major highways in the area. The following directions are
based on maps and talking to Joe & Bill from the JACG. There
accuracy cannot be 100% guaranteed since we didn't travel the routes

to verify them, but we did our best. Bringing a New Jersey map with Newark detailed along is advised.

Penn Station is located between Raymond Blvd. and Market Street, (one block east of McCarter Highway, Rt. 21). It is a large RR station and takes up the entire block. We will meet at the Information Gazebo on Sunday, March 26, 1995 at 12:00 noon. We expect the meeting to last about 3 hours.

Directions from Route 280:

Take Route 280 to McCarter Hwy south (Route 21). Take Route 21 (about 1 mile) to Raymond Blvd. Turn left onto Raymond Blvd. Penn Station will be found on your right.

Directions from Routes 1, 9, & 22:

Take McCarter Hwy north (Route 21) approximately 2 miles to either Market Street or Raymond Blvd. Make a right turn on to either of these roads and look for the entrance to Penn Station.

Directions from Route 95 (New Jersey Turnpike):

Take exit 14 (Newark Airport). Watch signs! Head towards the airport and exit onto Routes 1 & 9 south. Exit routes 1 & 9 onto McCarter Hwy north (Route 21). Take McCarter Hwy north (Route 21) to either Market Street or Raymond Blvd. Make a right turn on to either of these roads and look for the entrance to Penn Station.

From Long Island:

Take your choice of roads, bridges and tunnels to reach the New Jersey Turnpike (Route 95). Head on the Turnpike toward exit 14 (Newark Airport). Follow the directions above.

Take care,
Jon Mordosky
(NEAR*US Interim Chairman)

Me too! I just got a lot of mods I want to try (one to bump my 600XL to
256K with very complete XE compatability!). One thing I noticed in this
upgrade, even for the 64K upgrade of the 600XL it is reccomended to cut and
reconnect several of the address lines to the multiplexer chips (U5 & U6),
it is claimed that the 800XL address the memory slightly differently than
the 600XL, this fixes that. Anyone heard of this?

Screen shots are easy! :) Video tape a session and use ComputerEyes on an Atari, or some better (color) video capturer on another platform to get a snap of a screen. Upload it as a GIF and there ya go, you've got a snapshot which pretty much anyone can look at. :)

As for sound.. well, save it as a small .WAV file! ;^)

>Writing to the second side is no problem but formatting does not work.
>A 1050 drive can format the second side.
>
>Does anybody know how to get this working?

Since the XF551 needs/requires the index hole to format you'll need to create a new one for the back side. Get a 2nd floppy, turn the platter so the index hole in the media shows in the index hole in the "case". Turn this disk upside down and align it with the disk you need to make a "flippy". Mark the location for the index hole using a pen or pencil (be careful not to press too hard!). Do this for both sides of the disk. Now, get a single hole punch and lift the edge of the disk so you can slip the punch between the platter and the plastic case and center it over the place you marked. Punch! Do this for the other side. You now have a disk that can be formatted on an XF-551 (this will work for the RANA100 too), both sides. But... would'nt it be easier to just format the disk on a 1050?

Only the header has been changed. At least that's what it says in the docs for Xformer 2.5. I've used both - together and separately - with XF2.5 with no problems.

Do you have XF3.0 or XF3.10? If so, how does it rate? I'm most interested in the printer/modem capabilities. Also... what is the minimum system requirements?

JO> Can anyone offer any advice? Meanwhile, I am using Ice-T ver 0.0
JO> (thanks, M.C.!), so I am no longer as depressed as I was. But I would
JO> like to be able to download from ftp sites.

There are two types of XMODEM error correction, Christensen Checksum
and CRC. In all (if not most) terminal programs, detection of the
appropriate type is automatic with re-try. The fact that UUDECODE.BAS
--AND-- YAU.COM both produce the same results probably means that it is not
an error in either program. Corruption may occur in one or two binaries
that you FTP off of the network, but from --ALL-- of them? This is highly
unlikely, that --ALL-- binary programs on a site would become corrupted
simultaneously.... A better question to ask is, "Are you turning BINARY
transmission mode on before you FTP a file?" The first thing that you
should always do when using FTP is to type the word "BINARY" at the prompt,
before you even issue another command. FTP will respond with, "Type BINARY
has been set." or "Type I has been set." (file type 'I' is for binary

IMAGE). Only when BINARY mode has been confirmed should you then attempt to FTP any binary programs. This information is posted in most Archive's connect information. Did you bother to read it? Good luck with your next try!

P.S. Another problem could be that your mainframe site uses a 7-bit LAN with only a 7-bit data path (that is rare these days), or you could possibly have a broken cable (again, not very likely). Let us know if setting binary mode on FTP doesn't do the trick for you.

2601. Re: does US doubler work with 800?

JP> Does the SpartaDOS and/or the US-Doubler thing only work with the 800xl?
JP> Does anyone know why it would work just fine with the 800xl but fail
JP> completely on the 800?

But it doesn't fail completely. You said so yourself. It boots the
first few sectors. Actually, the later versions of SpartaDOS were not
designed to work with the ATARI 800. They need the RAM area under the OS
that is available on the ATARI 800XL/XE. That was why SpartaDOS was
originally incompatible with TUBRO BASIC and other programs that used the
RAM under the OS. You need to either find an early version of SpartaDOS
such as SpartaDOS version 1.0 from the SpartaDOS construction set, or else
you need to use the SpartaDOS DOS cartridge known as the SDX. Then you
should be able to read your SpartaDOS disks once more.

2603. games which are now free

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-25 22:32:00 UTC
From: roussin@genesis8.frmug.fr.net
Message-ID: <8A62584.00A4000337.uuout@genesis8.frmug.fr.net>
Source record: 93186
Cross-posted to: comp.sys.amstrad.8bit,comp.emulators.apple2,comp.emulators.cbm,comp.sys.sinclair,comp.sys.atari.8bit

As readers of comp.sys.amstrad.8bit already knows, Mark Haigh-Hutchinson of Vortex Software, has realeased as freeware the programs of his company for Amstrad CPC, but also for ZX 81, Spectrum and C64.

You can find them at :

ftp.nvg.unit.no /pub/sinclair/snaps/games/by-company/vortex/vtx_*.*
ftp.ibp.fr /pub/amstrad/games/vtx_*.*

Why did I write this to other newsgroups, for a good reason. Most of the programs which are on FTP sites are from a strict point of view, illegal. But some authors are willing to see users play their games. I read FAQs, but I saw nowhere a list of such games, well except in comp.sys.amstrad.8bit as I am the FAQ keeper. :-)

So could the FAQ keepers of the other 8bit newsgroups compil such a list, it would be a plus for everybody.

>What, exactly, are the Atari 2600, 7800, and anything else in
>between?
>
From the FAQ;

Computers:
400 Personal Computer (1979) 8-16K, membrane keyboard, 400/800 OS
800 Personal Computer (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16-64K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
800XE Home Computer (1987?)same as 130XE but 64K. Mostly eastern Europe.
65XE Personal Computer (1985) same as 800XL minus PBI
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
XE Game System (1987) same as 65XE plus Missle Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 Printer -40 col.
822 Thermal Printer -40 col.
825 80-Column Printer -req. 850
830 Acoustic Modem -300 baud req. 850, with Telelink I
835 Direct Connect Modem -300 baud, with Telelink II
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige &
black metal versions
1010 Program Recorder -Sanyo and Chelco versions
1020 Color Printer -40 col., print/plot in 4 colors
1025 80-Column Printer -7-pin dot matrix
1027 Letter-Quality Printer-80 col., letter quality
1029 Printer -7-pin dot matrix, same as Commodore MPS-801
1030 Direct Connect Modem -300 baud, with ModemLink
1050 Disk Drive -SS/ED 128K with DOS 3 or DOS 2.5
1064 -64K RAM module for 600XL
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem -300 baud, with XE Term
XMM801 Printer -80 col. Ribbon: Mannesman/Tally MS80
XDM121 Printer -80 col.letter quality. Ribbon: Silver Reed CF130
XF551 Disk Drive -DS/DD 360K with DOS XE
XEP80 Interface Module -80 col. video display and DB25 parallel port
SX212 Modem -1200 baud, rarely with SX-Express! package

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1200 1200XL internally, many slight cosmetic differences

800XLF 800XL incorporating a FREDDY chip (as in the XE's)
1250XLD Earlier concept of the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL Earlier concept of the 1450XLD
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
1090 XL Expansion System-for PBI, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XTM201 -non-impact printer
XTC201 -non-impact color printer

Don't worry Chris, the SIO2PC cable is childs play to build, just a hassel
and instructions for it can be found anywhere, but get one by all means, it
is a great tool.

2600 aka VCS (Video Computer System) color, cartridge based
video game first sold in 1977. New carts still in production!
(EdTris, by a hobbyist). You must remember it if you were around
in the early 80s. 6507 processor (1.19 MHz), 128 bytes of RAM.
4K ROM space. Lots of different models.

5200. First sold in 1982. Based on the Atari 400/800/1200
architecture (POKEY/ANTIC/GTIA). 6502, 16K RAM. 32K ROM space.
Not compatible with the other two, games or controllers.

7800. First sold (briefly) in 1984, full release in 1986.
Can run almost all 2600 games, but offers much more in
the way of graphics power for 7800-specific games.
6502C (1.79 MHz), 4K RAM. 52K ROM space.

People have this fear of sticking carts in a turned on
machine. Bill Wilkinson was quoted as saying it was A-OK,
but it still bugs people. UltraFix can be used like that.

Stacking the cart on top of SDX, with the power off.
Then turn it on, load translator, activate stacked cart.

2613. Re: Ben Smith at teleport

I'm almost ashamed to admit this amidst this diatribe, but I actually sent Ben Smith money, to purchase an 800 w/ a Bit-3 card and a happy 810 drive. He wanted $110 for both. That isn't totally unreasonable, is it? As soon as I receive the stuff, I'll post a followup message to atleast show that he's reliable.

Kevin

Oh, duh! :) I get it.. I kept thinking "yeah, boot w/ xlator & then load the program"... Mr. Kendrick forgot! "carts dont often let you boot disks!" :)

Oops... also, I have had no problem pulling carts out of my 1200XL.. sometimes that's how I reboot (if Action! crashed badly, for example). I usually do a coldstart (Control+F4.. thanks Bob Woolley), hold RESET and pull or push a cart in or out.

As for my 800XL.. It has no coldstart switch and it ****s up the RAMdisk sometimes when I do that.. Bugs me a lot >:^|

Hi:

I have a complete collection of COMPUTE! magazines from July 1982 through July 1985 for sale -- that's 37 issues of classic computing news/info/reviews
from the golden age of the C64, VIC 20, Atari 8-bit, Apple II. Also some coverage of TI-99/4A and PCjr. The whole bundle is going for $1 a pop ($37)
plus shipping costs. Some issues are as big as 350 pages plus!!!

Email DavidN9000@AOL.COM if interested.

2620. Re: 800 vs 800xl question

But... in general, the only carts you can use SDX to load a translator
before going to them are ones that allow disk boot. A lot of Romox stuff
just doesn't let you do that. IMO: A ram based translator that could
survive reset would be the best choice next to a real 800. That way
you could at least hold down the reset key while you plug the cart in.
I've had good luck with Omniview & next in line would be Omnimon
for compatibility. I think they still sell for more then a real 800 but
it's easy as flipping a switch.

jlI have a simple question. Does anyone know if cartridges that work in an jl800 will also work in an 800xl?

Technically yes, unless it requires critical timing. I know of only 1 that didn't, but you will never see one.
software wise, most of the time. GORF is a good example and there is another one as well. Atari's spaceinvaders works but the sound for the space ship doesn't work.

For completeness' sake, here's a list of all Activision
carts for the 8-bit computers. (from Kevin Chase)

Activision CZ-001-04 83 River Raid
Activision CZ-002-04 83 Kaboom!
Activision CZ-003-04 83 Mega Mania
Activision CZ-004-04 84 Pitfall
Activision CZ-005-04 84 Dreadnaught Factor, The
Activision CZ-007-04 84 H.E.R.O.
Activision CA-011-04 84 Pitfall II
Activision CA-012-04 83 Space Shuttle
Activision CC-101-04 84 Zone Ranger
Activision 84 Keystone Kapers
Activision CZ-010-04 84 Zenji
Activision Beamrider
Activision Decathlon
Activision Designer's Pencil, The
Activision Pastfinder

I guess an 800XL wouldn't survive a hardware reset if the Atari translator
were loaded? (One side allows for use of the RESET key)... but
I would assume when throwing in carts the system would return
to the XLos. OH well, just have to throw that omnimon switch. =)

Well I haven't seen many color monitors without audio, but assuming such you
have one (or if you want to run audio to an amp,) all the
monitor cables I have have 4 colored phono jacks on the monitor end,
composite, chroma, luminance, and yes, audio! B & C carries these (408)
986-9960.

Andrew, I've tried the cartridge trick i.e. first running a translator &
then hot plugging in a cart w/o success. I've heard rumors there were a
few OS out there that could survive: Ultra or something like that. I've
never really bothered to check. Seems like if you really wanted to you
could load your translator into ram, 'fake' a good DOS boot so a reset
well vector through the DOS init or vect & have that pointed to something
that will reset the ram translator OS & jump through the cart run vectors.
I know I did some of that with a few cart games I wanted to run from ram.
I don't think it took 10 bytes of code. If I get a chance I'll look at
it, but I'm not even sure if I have a copy of FIXXL around anymore.

Source record: 93220

I called Jim Hood today (Sunday, 26 May) to see how he was doing. Jim is the publisher of the new Atari Classics magazine. He was is good spirits despite the fact he could barely talk and is recovering from a cancer operation and undergoing radiation therapy. Jim had saliva gland cancer and that principle reason that the second issue of the magazine has be so long in coming. (I mentioned Jim's health problems a while back here on the net.)

The second issue is now at the printers. Jim's wife was buying the envelopes for the mailing when I talked to him. The issue should be mailed in a week or so. Bob Woolley and Jim's wife and son are helping to pick up the slack.

Jim remarked that he was finally getting ready to answer Ben Poehland's two postcards asking, "Where is the magazine," by saying, "Your 1995 issue of Atari Classics should be at your door in early April and your subscription has now been extended to be six years in length."

Anyway, Jim was cracking jokes left and right the whole telecon and this was from a guy who is eating through a tube in his nose and only has one vocal cord working. What a trooper!!!! Please keep him in your prayers. He wasn't sure what his long term prognosis was.

Hey guys,

I was at a local computer show today and some tailgater had an old device called an Atari Music Video System (or something like that). This thing allowed input of left and right audio and output patterns and colors to a TV. It looks like a piece of audio equipment. On the front were various knobs and buttons to control the output of the signal. On the bottom was a label indicating it was manufactured by Atari Inc. of Sunnyvale, CA.

I'd never seen or heard of this thing and thought I had a real find. Then the guy decides he oughta keep it--something about sentimental times spent staring at a screen.

Anybody ever seen this or have any info?

Hi:

I have two years of ANTIC magazine for sale:
Jan. - Dec. 1984 (except May)
Jan. - Dec. 1986
plus 5 issues of APX (Atari Program Exchange) monthly

Whole package for sale at $28 (that's a buck a pop!) plus postage.
Email DavidN9000@AOL.COM if interested!

2634. Looking for "Voice Master"???

I am looking for a product I saw advertised a long time ago -- I THINK it was called the Voice Master by Covox. Anyways, it is a small A/D board for the Atari series that comes with a simple voice recognition software...

If anyone has one of these laying around I'd be interested in buying it or trading other 8-bit equipment for it...

Please e-mail or simply reply to this post..

Thanks,
Steve Lin

: Does anyone out there know if I can use my 8-bit Atari with my Atari
: ST's monitor? I figure, if the Jag can use it, the 8-bit should be able
: to as well. Does anyone have the pin outs for the 8-bit and ST monitor
: jacks?

The Jag has RGB out. Atari 8-bits have composite and split video but not even the video chips themselves can be tapped for RGB directly.

Therefore it's best to use a C= 1080 or 1084 with the Atari8s if you are going to share a common monitor between the A8 and an RGB device such as the Jag because the 1080s have composite and split in addition to RGB.

In a message dated 3-25-95, Tim Irvin said:

"So how do you isolate the audio? If you plug in a monitor
jack, haven't you prevented another connection just for audio?"

A typical monitor cable goes from the DIN-5 plug to standard RCA plugs.
If you want to run the sound to an amplifier, just plug an extension
onto the RCA plug that carries the audio.

"I have an 800XL to a TV and the video sucks. I'd get a
monitor but I don't want to lose audio. What exactly does
someone with very limited electronics experience need to
get a good color monitor *and* sound from an 800XL?"

You appear to be suffering from the misperception that color monitors
lack audio. While this is true of most monochrome monitors, just about
every color composite monitor made includes a built-in amp and speaker.

Color monitors for the PC (i.e., CGA, EGA, VGA) typically lacked sound
support, but that is due to the PC's "serious" image. Color composite
monitors were sold for the "game" computers (i.e., Atari and Commodore
8-bits, TI-99/4A, etc.), and thus sound support was a "must".

Quoting bjcorr@delphi.com

b >I wonder what else Complete and Essential could contain?
b >bjcorr@delphi.com

While it is very like the original Mapping the Atari, the author of The Complete and Essential Map added a lot of information taken from mag articles and usergroup news letters about the xl/xe. There's also tons of programing examples in both basic (Turbo) and Mac65.

The Essential Map is a two book set (almost 400 pages)...book 1 is the map itself and book two is 43 appendices that cover just about everything you'd want in a reference work, plus the compete source listing to the xl/xe OS.

There's a review of The Essential Map in the current Current Notes.

2639. Re: Ultraspeed format in DOS 2.5?

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-27 09:17:02 UTC
From: Amos.Jackson@flight.org
Message-ID: <6c0_9503271226@flight.org>
Source record: 93237

The way I did this was to use a utility called fastload.bas, a SpartaDOS utility which allows you to format a floppy in any dentisy you want, and use ultraspeed skew if desired, and place a copy of DOS 2.5+ (the Atari DOS I used at the time) on the disk, run the basic program, which would write a small loader, and thus allow DOS 2.5+ to run in ultraspeed and double dentisy. It works VERY well, and will read or write flawlessly.

Amos Jackson

P.S. This was used in conjunction with a US Doubler 1050.

2640. ANSIterm

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-27 10:29:36 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.950327022150.9665A-100000@PEAK.ORG>
Source record: 93228

Whew! Made it back from the North, and found "Ansiterm" in my disks. Perhaps I am a little behind in the terminal scene (I am eager to try Flickerterm and Ice-T), but I thought the only VT100 emulator that does 80-columns was the old "VT-10squared" public domain program.

Remember that one? You had to load the translator if not running an old 400/800. It only went to 1200 baud.

Then I find ANSI term. It goes to 9600, but who knows if it can keep up. It sort of seems like it falls behind a little at 2400 when the screen gets full, but I'm too inexperienced as of yet to judge. However, I must say that it is pleasently surprising to be able to use my XE as a readable, usable 80-column terminal. On the Commodore 1084s, the display is very sharp as hooked through sep. chroma/lumi. On a TV, things look a a little blurry, but I found that through this blur, it still looks as readible as a 640x200 80-column screeen (Amiga, ST) on a TV. I'm impressed. Now if it could only download......

The Speedy 1050 mod comes from continental Europe, Germany I think, anyway although it gives 180k per side of a disk, it DOES NOT give 180k in the same way as a Happy/US Doubler 1050 would! In fact the two 180k formats are incompatible with each other, so I'm not sure that a Speedy will be able to produce Utltra Speed IO.

I know of several people who have the Speedy but have found out that their Rob C, Multiboot etc menu software doesn't work!

Hello !!!

Here I am with a problem especially for the German users.
Does anybody have the current adress of Peter Finzel, the man who coded
Atmas II or Schreckenstein, founded the PfP and did the Assemblercorner in
the "Atari-Magazin".
I'm going to write to him to let some of his programs Shareware, but the
letter returnd - I only had the adress of the Atmas II manual ('85).
So please send me the adress.

Matt

P.S. You could send also the adresses of other authors in Germany to me - I
try to write them !

P.P.S. Would be very nice if some authors reading this would give there
programs to the shareware.
Would be also nice to have the PROFIBUCH as textfile on Umich - how about
this, Julian Reschke ?

You sure? I *didn't* stick it out with Antic until the very end and I know I saw Miniature Golf (plus construction kit) in the issues I received. Right before Antic went under, it was simply a wee insert inside of STart.

This is wonderful news. I remember this as one of the titles Atari announced when they had an odd burst of renewed interest in the 8-bits a while back, and I looked forward to many of them. I have since got two ST machines as well, but this has strengthened my love for the old 800XL even more. I was upset that Black Lamp, a supposedly great game, was only on cassette upon initial release all those years ago.

Now these it's tempting, along with Tube Baddies, at the low price of 5 quid each you can't go wrong. These bloody ST games, amazing that they are (I just spent 20 pounds on the fantastic STARDUST, but it has not arrived yet...) I can't afford them as regularly as XL ones at this price. Sad that my XL is at home (I'm currently at uni' with my STE).

Someone post a review when it comes out. Gameplay - sound - graphics, you know, the biz. Compare it with some well known titles. I hope to get back into the XL in a big way, then again I never really left it.

Cheers

S.Lai

I'm lookin' for some obscure info for my "Giant List of Classic Game Designers" which is posted every so often to rec.games.video.classic.

Who wrote Star Sentry, one of the few commercial games released by ANALOG Software (part of ANALOG Computing in the early days of the magazine)?

And has anyone played Maniac, a Berzerk clone printed when issues of ANALOG were in the single digits? Was this a BASIC or assembly game? And who wrote it? (I'm curious to see if it's one of the regulars--e.g. Bachand, Hudson).

Actually, SD did not start naming files with the .COM extender. I believe the first Atari style DOS to start using that type of .COM/.EXE extenders was OS/A or DOS xl. These were really older then the hills, for instance Phantasie I & II used DOS xl with those file conventions. From a historical note, CP/M used the .COM extender before there ever was an Atari. SD doesn't have to use the extender, for instance typing OMNICOM.OBJ from the command line works just a well as typing OMNICOM for a file with a .COM extention. The real contest is to find the genius who thought of using .OBJ as a description for an executable file in the first place. I think that term OBJ is a little misleading, object is a noun as opposed to an adjective or a verb, a little out of place when you think about it.

Maniac! was in ANALOG #6. It was ML, but like all ANALOG ML games, it
was a BASIC "loader" with a lot of DATA statements. This one wrote
a cassette version. Author was Rick Messner.

In issue #8, some modifications were printed so it could write
to disk. Author was Stephen Vance.

I dled the ANALOG Compendium from GEnie, which is why I
know this.

2656. 400/800 cart list and other ???s

Also, "Deluxe Invaders" and "Gorf" by Roklan are two cartridges which won't run on the XL series (only 400/800).

I think the Ultraspeed+ OS from CSS allows one to switch between the Ultraspeed OS, the standard XL OS, and even the 400/800 OS. That way, you can run all carts on the XL.

I just brought down my Indus GT to serve me away from home, and I am distressed at how noisy it is. It works great, but I guess it needs lubrication. I've never had an Indus GT apart; I've looked inside 1050 drives on many occasions.

Seems like one time (about 10 years ago) I started to take apart an Indus GT for curiosity, and then decided that it looked cluttered and that stuff would fall out if I pulled the cover off, so I didn't. I must have been wrong, eh? It's easy, right?

What about oilng the slide rails? Will any oil work, as long as you're careful not to get it on any other parts? (Can I pull the dipstick out of my car and drop a couple drops of motor oil on there, should I buy a small tin of sewing machine oil?)

How about the drive belt? I remember one BBS sysop (back in the days of running a BBS on floppies) who had one of the belts in his drive start slipping, and this destroyed the files on his disk. Is there any preventative maintenance that can be done to eliminate this problem? Perhaps removing the belt and wiping the pulleys clean with lacquer thinner might remove any dust and junk that would allow the belt to slip.

WHAT I'D REALLY LIKE TO KNOW IS WHERE I CAN BUY NEW BELTS FOR MY INDUS AND 1050 DRIVES. Are the mechanisms in the Indus and the 1050 the same, or do they use the same belts?

Thanks in advance for any tips you can throw my way!!!

James

2660. GORE Demo

Newsgroup: comp.sys.atari.8bit

Just dug up my Atari 800XL machine from the garage. I've got a new Mac
and don't really need this stuff anymore. Let me know if anyone wants it
and how much it's worth. All offers considered for all or part.

800XL 64k with PS, monitor cable, no docs
1030 modem, with data cable, no PS, no Docs
1050 drive, with data cable, PS, no docs (bunch of disks, DOS 3)

Let me know if you are interested

Well, I want F-keys, but I mentioned that because I was drolling over
the stuff I read in Mapping the XL.

I guess I'd settle for separate F-keys, but I so love the original 1200XL
keyboard! :^]

Man, maybe I'd better just say screw it, get a Transkey and stuff my 800XL
in a box.

Hey, what IS the name of the 8-bit in a PC-case mod. anyways? I'm sick
of calling it "the 8-bit in a PC-case mod."! :)

2667. MIO and Bernoulli Drives

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-28 07:20:24 UTC
From: bjcorr@delphi.com
Message-ID: <9503280153591.DLITE.bjcorr@delphi.com>
Source record: 93109

Does anyone here know if the MIO will work with the old Iomega 10meg Bernoulli Drives? I had heard from someone at Delphi (who supposedly heard from ICD) that it is a straight through affair, has anyone here ever used this combo? If so, how do you format the Bernoulli? I haven't seen an ICD utility that can do it, although I am new to the 8-bit HD world.
Thanks,
bjcorr@delphi.com

: GS> defacto standard.
:
: Huh? MYDOS lacks NOTE and POINT ? Then what was all the fuss about
: MYDOS 4.53 supporting a three byte NOTE and POINT ? Of course MYDOS has
: NOTE and POINT! I think you should clear up this point before it creates
: some confusion (mainly, that SpartaDOS does it differently, i.e. relative
: offsets versus absolute file SEEKs). Unless you are using a serial device
: such as a tape drive or datasette, you'd --BETTER-- be able to provide
: random access to file sectors. Otherwise, there is something terribly wrong
: with the heads of your disk drive if they can only move serially! ;-)

It's poor note and point. Sector and byte offsets BITE. SpartaDOS uses
a 3byte poke to allow you to point to the xth byte of a file directly,
which is faster and easier to use in applications.

If AmigaDOS/MYDOS had viable note and point, then absolute note and point
on SS/SD disks and custom fms's would not be standard fare for database
programs like Diskbase.

Sparta may be less stable, but for desigining databaselike applicaions
(which is what message bases are) it blows Mydos out of the water.

BBS software did not settle with Sparta out of some prejudice against MYDOS.

2669. Re: XF2.5 or 3.0 XFD images -v- SIO2PC ATR images

> Are XFD and ATR images the same thing? Can you interchange SIO2PC and
> XF25 images back and forth with one another?
I don't know much about these formats, but perhaps this is a little help
for you:
As I could see from looking at my XFD-files there's no information about
the size of the disk, just a dump of a single sided single density disk.
The ATR-image contains a 16 (or 32) byte header containing information
about sector size, number of sectors etc. If you want to know more about
it, just write me an email, I will have a look at my notices.

Bye, Oliver

2670. Complete & Essential Map!

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-28 13:26:40 UTC
From: CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK
Message-ID: <6EE076554@east-01.novell.leeds.ac.uk>
Source record: 93113

I have a copy of this Complete & Essential Map book but I haven't really looked at it much since I've had a bit of trouble with the publishers TWAUG recently, they printed a rather nasty article about me and my products, but anyway thats another story.....

The thing that does bother me though, copyright still exists on the Atari 8-bit OS and BASIC code right? Then how and why can they legally publish a complete listing of the OS source code. I have been advised that even looking at copyrighted code is technically illegal, something to do with 'reverse compiling' so I've been told?
Also the book does contain quite long sentences that have been copied directly out of Mapping The Atari, quite probably without the publisher's consent! I just thought I would point these facts out, there's no doubt the book is quite good but to be honest some of the content is of a somewhat dubious nature!

>cart list for the 400/800?

Here is a cart list for the Atari 8-bit family of computers. Kevin Chase put it together a while ago. This copy is a little old, and isn't exactly the same as Kevin's published version (I made personal changes to it), but his e-mail address is included, so you could check with him for a newer version.

Classic Atari Cartridges for the 400/800/XL/XE computer, v. 3.0

Some of the list has been distilled from old magazine ads and reviews, and may be subject to error. Entries with question marks after them may not exist in cartridge form, or worse, may not have been released at all.

I'd would like help completing this list. Comments, additions, and words of encouragement are all appreciated, and will be noted in the contribrutors list at the end of this post.

Kevin Chase <chase@physics.rutgers.edu>

NR = Never Released
(???) = Was it a cartridge?
?xx = year not known for certain
n/a = catalog number not applicable, no number assigned by vendor

2675. 256Kb SIMM expansion for 800XL

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-28 18:16:14 UTC
From: l37531@ci.ist.utl.pt
Message-ID: <3l9jpe$4d5@alfa.ist.utl.pt>
Source record: 93108

I hope someone can help with this one ...

I'm upgrading my atari 800XL memory to 256Kb, but instead of using 41256 memories I'm trying to use a 256Kb SIMM module. The module has 2 44256 on it, plus a 41256 (parity) but that one isn't needed here. I designed and builded a circuit board, pretty much the same as the one described on the 256Kb expansion at umich, except that it also has connections for the SIMM. Well, It worked. Sort of. I have two problems:

1. It takes about 80 seconds for the memories to start working properly. I imagine it's due to diferent refresh needs. I power up, nothing happens; after 4 or 5 (soft) resets it goes directly to memory test, indicating several memory errors; a few resets later (never powering down) it finally boots up fine, without a single memory error. Can anyone help cure this? I can't do nothing if I have to wait forever before I can boot!

2. After (finally!) powering up sucessfully, it works fine, as I said. Memory banking also. BUT! When I want to cold boot, it's a pain! I have to power down for at least 40 seconds for the memories to erase them selves! The module consumes much less than the standard 41256, so, instead of the regular 5 or 10 seconds wait, I have to wait forever! It's very funny, really! I power down, wait 20 seconds, power up, and it's just like I pressed reset! Everything is there, the memory is intact! Unbelievable! I imagine that I must change the capacitor, but will that have secondary effects ?

Any help would be appreciated. If someone has done it before, please tell me how. I don't want to buy 41256, since I have 4 256Kb modules at home! HELP!

Pedro Fonseca

PS1: Mine is a REV D atari 800XL. ANTIC is neither COxxx96 nor 97, but a COxxx98. It does refresh A8, doesn't it ? Since all I read only mentions rev B and C, I'm not sure about this ... It seemed to work fine though.

PS2: (To portugal) Se algum Portugues estiver a ler isto, manda um mail pa! E dificil encontrar portugueses com atari! Podemos trocar coisas.

2677. Re: 8-bit Stuff For Your Consideration

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-28 19:40:04 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <135846@cup.portal.com>
Source record: 93116

It's been years since I ran a BBCS board, but what I remember is you had to use the BBCS editor to make all the menu's. I think there were a number of standard file names you had to use to get it to run right. For instance, you had to have a 'LOGBULL.xxx' file for your login message, 'NEWUSER' or something like that, ...
The menu editor wasn't that bad, but it was something you had to leard whoops! 'learn' how to use, it was similar to some database programs I've used. At the time I only had an Axiom AT<something> printer & I think the docs included on disk were about 30 pages. The print quality of the Axiom + the complexity of the program were enough to give me gray hair. The real down side was the message house keeping program, MEDIATE<?> was busted! I believe this was the 3rd software package I'd gotten from the Antic Catalogue, the others being Rambrant & Envision, all with flawed files on them. Needless to say, even when there was a local sale on Antic software $1 a title I didn't buy any.
As far as using a board with BBCS, I really liked the interface. Maybe not as many features as something like Carina, but IMO easier to use because of it's menus. Some of the stuff was overkill, something goofy like 64k security levels. I ended up giving everyone the same clearance on the first call with myself being the only exception. That was so I could work at home, then call the BBS from work to transfer the files.
Rick

I am looking for any of the lab kits that used to be put out by
Broderbund. There were light, temperature, and other kits that interfaced
witht he Atari 800's and 800xl's. Thanks

I can't imagine how looking at something could be illegal in itself. Unless it's something particular to UK copyright law. But yes, the Atari 8-bit OS and BASIC code aren't in the PD, and I seriously doubt TWAUG got permission from Atari to publish them. So they most likely published it illegally.

>Also the book does contain quite long sentences that have been copied
>directly out of Mapping The Atari, quite probably without the
>publisher's consent! I just thought I would point these facts out,
>there's no doubt the book is quite good but to be honest some of the
>content is of a somewhat dubious nature!

My feelings exactly. Not just little bits, but a very substantial amount of the intellectual content of TWAUG's book is pirated, either from Mapping or from Atari. Just go through and compare them, address by address. Not just the information was copied, but most of Ian Chadwick's writing, word for word.

Given Atari's past non-actions, they probably don't care. But whoever owns the rights to Mapping (either Ian Chadwick or whoever bought out Compute recently) might be interested to know how that text has been redistributed for TWAUG's profit. From the way Complete&Essential reads, I really doubt there was any agreement prior to publication.

2682. Ice-T 2.0 XE

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-28 22:23:32 UTC
From: bruck@brachot.jct.ac.il
Message-ID: <D668v8.CBo@itex.jct.ac.il>
Source record: 93131

A beta version of Ice-T 2.0 XE is now out. It includes all the features of Ice-T 1.0 plus a few more, but its basic requirement is that you have 128K.

* Faster, but *still* not good enough for 9600 (see below)
* 8 page backscroll buffer, as opposed to just one
* Fixed one or two annoying bugs, but some are still there.
* File viewer (pretty identical to my older Col80 text viewer, but allows fine scrolling)
* 16K capture buffer
* Xmodem download completed (anyone who's seen 1.0 knows what I mean)
* PC character set for all chars above 127 (toggleable)
* Dialling menu - incomplete. You need an external text editor to create and edit entries (up to 20)
* Final version will include a *good* macro capability, but I haven't started doing that just yet. I also hope to debug it some more. Adding more file transfer types comes *last*, folks. The program is very usable and I don't find anything wrong in quitting to DOS and loading Kermit-65 or Atar-Z-Modem (which both work fine).

As for speed: Right now the 80-column screen goes to just under 1600 cps. The problem is that when the stuff is coming from the modem, there's an interrupt for every single byte that comes in - which slows things down horribly! Cuts down cps by about half, which, according to my calculation, means it's not enough for 9600. I also lose data at 9600 (null-modeming using my Sio2pc cable with PC dumping text) even though no buffer is overflowing! This is quite frustrating, and I have no idea of what I should do about this!

That's all for tonight folks.. Ice-T 2.0 XE can be requested directly from me only.

I don't think the issue here is just FREE. I just don't understand it,
because I can get C64 software, most of which was made by the same
software companies for Atari as well, for FREE. And I think even $2 for
a game now is too much if I consider getting all 1600 games I had for
my 8 bit.

>software companies for Atari as well, for FREE. And I think even $2 for
>a game now is too much if I consider getting all 1600 games I had for
>my 8 bit.

Well, this is a tough call. Certainly, once a game is no longer being
sold commercially, it would seem petty to hold (or worse, enforce) a
copyright on that software. If I wanted the XYZ game and there was
absolutely no way to obtain it through commercial retailers, I wouldn't
feel morally wrong if I obtained it via a free copy. (I might not do it
since it's illegal, but morally I wouldn't think it wrong.) Once the
stores no longer have it and the developer no longer produces, sells
or supports it, that's the signal that something needs to go PD.

But yet, there still are some commercial outlets for 8-bit software,
although some software titles are almost certainly not being sold
legitimately anywhere. These places--and I speak of places like
ATV, B&C, Best and so on--are invaluable to us 8-bit enthusiasts
since they give us a "fallback" position; namely, if we can't obtain
something for next to nothing via the net, for example, we *still*
have a source which probably has (or can get) what you're looking
for. Though few of us rely on them for most of our software, I'd
imagine, isn't it nice to know that they are there if you really
want or need something and searches on the net come up empty? Or
if you need something quickly and you don't have time to go
searching all over for it? Isn't that worth having to pay a few
bucks once in a while?

Personally, if I can get most of my stuff free or cheap, I think it's
worthwhile to pay the occasional $5 or $10 (or $29.95 as when I

purchased M.U.L.E. from B&C) if it helps keep stuff commercially available. It's a small price to pay, I think, to keep the places around and help keep 8-bit computing viable. Living as I do--with B&C and Best less than 15 miles from home and work--it's a *huge* bonus to be able to just walk in, get what you need and get out--no looking for items, no hassles of shipping or waiting weeks for stuff to arrive...a bit more expensive, but *very* much worth it when the need arises.

As long as stuff is commercially available, it should *not* be PD.

[utopian "pipe dream" follows]

The state of 8-bit computing is such that a "clearinghouse" approach would be cool: if the "clearinghouse" (perhaps consisting of a few remaining 8-bit vendors) can confirm that a certain title is no longer available commercially, it would become PD unless the original manufacturer decided to produce more copies and release them. That would not kill sales for titles still available, and perhaps the hit the vendors may take from people opting for free titles would be offset by an increase in interest of 8-bitting in general. More people may rediscover the 8-bit (or keep it around longer) if they knew they had no problems getting the software they want/need. Even if they lost software sales, they could see a growth in hardware sales as the wide availability of cheap/free software rekindled interest in the 8-bit line.

Naah. Too utopian. :)

And if $2 is too much for a game, you must not really want it very badly...so how is not being able to acquire it an major issue?

Could someone explain Sweet 16 some more. I've gotten incomplete info on its potential for 24-bit addressable memory.

John Harris told me that '24-bit linear ram is an easy thing to do via the PBI' which means that it's not going to have a SIMM slot on the board itself. That's just wonderful for BB or MIO users who will not be able to daisy chain their interfaces if and when a RAM board arrives for the PBI (I have yet to hear of anyone developing a successful PBI daisy chain with the BB or MIO--Chuck Steinman tried with the mv80).

The mortal PATERSON, DAVID ANDREW wrote:

: Let's remember, though, that the Atari 800 and 800xl OS, along with the
: BASIC have all been essentially released to the public as freeware.
: Notice that PCXformer is distributed with all those included. Darek had
: a number of problems with Atari with the original STXformer, as I recall.

I don't think anyone should be criticized for treating it as such, after all, Atari is impeding progress, but I'm also pretty certain that Atari has not released them into the public domain.

I will take advantage of the disassemblies, etc... but there is always a chance that Atari will be assholes and go after them. It wasn't that long ago that Bob Puff and others had to license the XL/XE OS so they could release their own modified OSs.

Atari will grant certain priveleges on a case-by-case basis, and I'm sure Darek had to petition Atari to do so, but they have rejected putting it into the public domain.

It's not that they will ever DO anything productive with the rights, it's just too important for them as a possible source of pocket change income via lawsuits.

Source record: 93140

I've noticed that a number of people have been trying to get the 800 OS
onto the XL's to play certain games and they use translators which load from
disk with the SpartaDOS X's piggy back cartridge to help play cartridges. Someone
also mentioned the use of Omnimon or Ultimon to emulate the 800. I have a question
why not get an EPROM chip with the 800OS zapped onto it? This is what I have. I have
Two OS's in my machine with the /CS lines connected to a switch and all other lines
in parallel. Whenever I want to use either OS I just flip a switch accordingly!
All that's needed for this is the 800 OS chip a pull-up-resistor, a switch and
some wire! Any thoughts?

Jason Keane.

2698. FTe to release MARS 8 in May!!

Hi everyone,

It's been busy out here in California with the bad weather and getting ready for the ACE '95 show in Toronto. Busy enough in-fact that I haven't been monitoring the phones for a while...

Well, The MARS 8 is finished, and will be going into production during the end of April. I will be showing a prototype in Canada, and hopefully there are people out there still interested in this "wonder-board" for the Atari 8-Bits. There have been a few minor changes, and I'll keep everyone here up to date as soon as the finished PC boards arrive and are fully tested...

It's only about one month away, so if you are interested please direct any inquiries here as I'll be in Canada during the next week or so.

The Sweet 16 microprocessor upgrade boards are now available, and the MIO II's are very soon to follow...

The next 3 months have some very interesting things that are going to debut for the Atari 8-bits in-store... Stay Tooned!

Mike

>I was lucky in gaining the one-time license to do the Starpath CD.
Does exist a ATARI8 CD ? How can it git a copy (or two 8-)) ?

>But Atari's take on the Atari8 is different, and altogether irrational.
>There have been gestures within the last 3 years to attempt to get Atari
>to release things into the PD but they won't do it.
I can't understand Atari - They don't do anything for the XL for many
years now (support became very lausy since ST was out) - so they should be
lucky that some "crazy" people still use their product and let free their
soft !!!
To copyright as whole : I think that all old Soft ('til 1990 or so)
should be free and be available on UMich !!!
I can't agree with the argument that some vendor's will cry then !!!
Does anybody of them think that those people buying cartridges of old games
there (for horrobile prices mostly) do this because they want to game this ?
I think that the cart's are only bought because of collecting them !

I'm waiting for your answers , Boyz (and Girls) !!!

I strongly agree with Atari software being made freeware. In east Europe
people have thousands of copies of games and programs. The reason is that
no one was selling any software for those computers there but they sure
sold the computer. So what was, for example I, supposed to do? I signed up
with a government sponsored club and copied software I wanted during the
meatings. I think similar problem is everywhere now. It is extremely hard
to get the original software anymore but very easy to get a copy of it.
Many users will be much happier if Atari declared all the software as
freeware.

The XL Boss on my 800XL works just like that. Flip a switch and you are into the 800 OS, flip the other way it is 800XL. I like the old OS better since you do not have to hold a key to disable basic when loading a game.

: >keyboard! :^]
: >

: It shouldn't be too hard to graft a 1200xl keyboard on; the OS didn't
: really change substantially until the xegs came out. Check out the
: self-test routines: the computer is readey to handle the F-keys. Get a
: set of 1200xl schematics and compare them with the 800xl.

I don't have the 1200XL keyboard notes with me that some kind
soul on here sent me about a year ago.. but esentually, (and this
is what I thought you would do) you just have to wire the 2 keyboard
decoding chips on the 1200XL to the chips on the 800XL. i.e.
take that ribbon connector from the 1200XL and wire them into the
chips sockets of the 800XL's keyboard chips (after removing them
of course.) Then you can just wire the select/start/reset/option/help
keys to their respective pins on the original 800XL keyboard connector.

I don't think the issue here is just FREE. I just don't understand it,
because I can get C64 software, most of which was made by the same
software companies for Atari as well, for FREE. And I think even $2 for
a game now is too much if I consider getting all 1600 games I had for
my 8 bit.

Source record: 92974

I picked up some really cool memorabilia today. I got the binder that Atari supplied to it's computer dealers in 1980 or 1981.

It is a sort of dark tan color with Atari Personal Computer Systems and the logo on the front and spine. The inside contains the following sections behind colored tabs:

1. Software Catalog
2. Product Specifications
3. Operator's Manuals
4. Instruction Manuals
5. Retail Price List
6. CDC Locations (this is Control Data Corp--used to do repairs)
7. PCS Representative Packages
8. Newsbits
9. Basic Reference Manual
10. _____ (this appears to be for the owners use, notes, etc.)

The contents of the one I found are in EXCELLENT condition. A couple of highlights:

**1981 Catalog: Atari Personal Computer Product Catalog, Computers for People (CO17535)

**Spring 1981 Authorized Dealer List(CO17689)

**Volume 1 Number 1 of The Atari Connection (YES!!!!)

And there are a lot of product guides, manuals etc. for various of the 8 bit hardware available during the period.

Pretty cool, eh?

The AtariLab kits were actaully released by Atari. There were
only two that I know of, the Starter Kit which included the temperature
probe, cartridge and interface box, and the Light Module which had a
photoelectric sensor and some filters. I have both of these and have
never seen any others.

This was another case of "too little, too late"! If Atari had
made more kits available earlier and marketed them aggressively, they may
have been able to penetrate the educational market.

Atari themselves published the source code for the OS in their technical manuals. It's obviously still copyrighted though. At least in that form. There was some question back in the late '80s as to whether Atari's free distribution of the Translator disk for the XL's without a copyright notice may have jeopardized their position. Either way, it's a moot point!

I have to list these 'Representative Packages' as a reminder of what the
power of Atari cost in 1981:

1. The Introductory System

Atari 400 (8k Ram) $630.00
Atari 410 Recorder $ 89.95

TOTAL: $719.95

skipping some*

3. Home Communication System

Atari 400 (8k Ram) $630.00
Atari 830 Modem $ 199.95
Atari 850 Interface $219.95
CXL4015 Telelink 1 $ 24.95

TOTAL: $1,074.85

skipping some*

5. Professional Home/Office

Atari 800 (16k Ram) $1,080.00
Atari 810 Disk Drive $ 699.95 (ouch!)
Atari 820 40 col. printer $599.95

TOTAL: $2,379.90 (double ouch!)

And the 'ultimate'......

6. The Atari Accountant for Business

Atari 800 (16 k Ram) $1,080.00
CX853 (2) 32k Ram $ 399.90
2 Atari 810 Drives $1,399.90
Atari 850 Interface $219.95
Atari 825 80 col printer $ 999.95

Total: $ 4,099.70

Imagine--all that power for only $4,000.....:)

It's hard to believe, looking back, that we could spend so much on what
now appears to be so little...

My first 1200XL was purchased in 1983, as a close-out, for a bargain
basement $199. The refurbished 810 (with no face plate) was $160, a
real bargain back then, even without the faceplate.

: Imagine--all that power for only $4,000.....:)

Yikes. Even Ben Smith can beat that. I'd hate to see what Ben Smith
would have charged for this stuff in 1981... :)

2727. WTBuy preferably trade for: 8 bit comp,etc

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-29 04:29:54 UTC
From: rhett@bigwpi.WPI.EDU
Message-ID: <3lano2$l33@bigboote.WPI.EDU>
Source record: 93135

regretfully, a year and a half ago i traded my 130xe for some other
computer stuff and would really like to get back into the atari 8bit
world. i have lots of software still and i miss it!
anyway, i want the following:
8bit Computer:65xe,65xegs,130xe or something at least equivalent
Floppy drive: 1050 or better, would like the xf or one of the nice
indus jobbies,with connecting cables of course
Game cartridges: any and all

I have the following for trade or sale:
1 Broken 1040 STf: some memory problem, trouble acknowledging hard disk
working drive, etc.
APPROX VALUE TO ME: $50
1 Working 1040 STf:great shape, no problems.mouse and stuff, of course
APPROX VALUE TO ME: $125
24 pin dot matrix printer: cant remember the brand name right off hand
(canon, maybe?) ask if you want
APPROX VALUE TO ME:$50

would rather sell the working st and trade for the other two, but will
entertain reasonable offers (including cash+merchandise deals)
also looking for a working lynx or lynxII and carts!
thanks
rhett@wpi.wpi.edu

2731. Re: SIO2PC Cable

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-29 05:40:04 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3larrk$fok@nic-nac.CSU.net>
Source record: 92972

You can build your own SIO2PC cable (or have someone else do it for you)
buy either buying the parts yourself or purchasing the parts from Nick
Kennedy (the designer (I guess) and author) (costs ~$30 I think), or
you can purchase a cable from Nick (~$50 last I heard) or someone else
who makes them (I heard $50 from someone in e-mail once.. seems very
steep, IMO..)

As for using it, it's a joy (unless you're dealing with copying disks
back and forth with MyDOS and/or using DiskCommunicator. Remember this
when trying to [J]-Duplicate-Disks.. set the density and format the
thing manually FIRST, THEN when you do a Dup-Disk, use the "/N"-don't-format
switch otherwise if you're Dup'ing a 1050 127k disk onto a 130k SIO2PC
disk image, it'll get screwed up and think the SIO2PC image is only 90k
(810 density)).

You can have up to 4 drives, each from 64K to 16MB in size, available for
the Atari (and if you have 4 real drives, they can be used as well, giving
you 8 total (why SIO2PC doesn't handle 8 already is beyond me..)).

The program is a little hokey at times, but allows for Print through
(P: redirection to: PC printer, PC screen, or PC file with any combination
of EOF->CR or CR/LF , 8th-bit stripping , and TAB conversion translation
modes active.)

It comes with two programs for the Atari, REMOTE (lets you control the SIO2PC
menu from the Atari instead of the actual PC itself) and FILE2PC (which
dumps files from the Atari onto the PC's drives (as opposed to just within
Disk Image files)).

Other programs you'll want to get include DCM2DSK which converts DiskComm-
unicator 3.2 ".DCM" disk images into SIO2PC ".ATR" disk images,
S2PC and/or ATARIMG which manipulate files between the PC and within
".ATR" disk images,
and "TT", an Atari text <-> PC text conversion program;
all of these are for the PC, by the way.

SIO2PC supports UltraSpeed (controlled by the Atari, but for some reason
there's a toggle command in the SIO2PC software). I've used it wit SpartaDOS
(disk-based) and some demos use it, but unfortunately MyDOS doesn't support
it (and at the moment, I'm sticking with MyDOS), so I don't usually see
TOO major a speed difference between my Atari 1050 floppy drives and SIO2PC
(probably about twice as fast at the most.. nothing compared to a RAMdisk).

SIO2PC uses as much of your 640K RAM as you have available (it's a small
program, I usually have 530-540K free) (also, you can shell out to DOS
from it if you want/need to and it has a simple directory command (short

listing though <sigh>) as well as a "within-an-ATR-file" directory command)).

It DOESN'T use RAM outside of the PC's base 640K (PC's suck, man.. they SUCK! :)). How does it handle 16MB disk images? It just accesses them off of the PC's drives (not very much slower, even with my slow-as-hell hard drive!.. of course, I don't think I've ever booted Ultra-Speed-using demos while they're in my PC'S RAM, only by accessing them "physically" from the Hard Drive... hmm... experiment time!).

Anyway, (if you can't tell) even if you DO have enough RAM to load up an entire disk image into RAM, you can force it to access it only from the HD (which is what I do). Be careful not to screw up your files though! Sometimes the saftey of having a backup of a disk you're playing with still somewhere safe (not in the PC's RAM) and screwing around with a temporary copy (IN the PC's RAM) can be very handy! :)

The program runs on any PC, but setting the timing and crap correctly looks to be a pain. I'm fortunate enough (HAHAHAHA) to have such a slow PC (an IBM 8086 / 4MHz-based PS/2 (model #25)) that I've never had trouble using it, but once I tried booting my 1200XL off of a friend's 486 using SIO2PC and it didn't work worth a damn (can someone help me with this, by the way??????????????!?!?!??!!?!?)...

Anyway, I hope that's enough details. Oh yeah, PC Xformer can handle SIO2PC "ATR" disk images (but currently SIO2PC can't handle ST Xformer / PC Xformer "XFD" disk images).

Good luck! Nice program (too bad no modem support (yet) and no multi-tasking! :))

Broderbund's series (forgot the title) was never released for Atari,
Apple II only.

Atari had there own "AtariLab" series. Temperature and Light
modules did come out. Biofeedback, Lie Detector, Mechanics
and Timekeeper were planned.

: there's no doubt the book is quite good but to be honest some of the
: content is of a somewhat dubious nature!

My feeling on this is that we are SOOO long in the tooth in the days of the Atari8, and Atari isn't going to suddenly become nice guys and relinquish the rights, that anyone who wants to promote an understanding the XL/XE OS in a last ditch effort to try to encourage some more programming, is to be supported.

I was lucky in gaining the one-time license to do the Starpath CD. But Atari's take on the Atari8 is different, and altogether irrational. There have been gestures within the last 3 years to attempt to get Atari to release things into the PD but they won't do it.

So Atari and Compute can go to hell for all I care.

Let's remember, though, that the Atari 800 and 800xl OS, along with the
BASIC have all been essentially released to the public as freeware.
Notice that PCXformer is distributed with all those included. Darek had
a number of problems with Atari with the original STXformer, as I recall.

It shouldn't be too hard to graft a 1200xl keyboard on; the OS didn't really change substantially until the xegs came out. Check out the self-test routines: the computer is readey to handle the F-keys. Get a set of 1200xl schematics and compare them with the 800xl.

BBSCS was the program used on my all-time favourite Atari 8-bit board - The Pig and Whistle BBS. It crashed regularly. But a feature that was a godsend to 300 baud users like myself was its hotkey facility. If a long menu was being sent from the BBS, and the user typed one of the command keys, BBSCS would stop printing the menu and immediately execute the command. Users could select regular or brief menus. Brief menus were the same as the regular ones, but cut off after about 15 characters or so. Lead to some rather peculiar options, though.

Each of these were released in 1984. I own the "Dance" and "Levels" for 8-bit (but alas no system yet) and "Linking" for Colecovision.

The serial numbers: (from memory)

Dance Fantasy DFA-ATR
Linking Logic LLL-ATR
Memory Manor MMA-ATR
Logic Levels LLV-ATR

In a messaged dated 3-26-95, speaking of his COMPUTE! collection, davidn9000@AOL.COM said:

"Some issues are as big as 350 pages plus!!!"

<nitpick mode on>

Well, if you check closely, I think you will find only one issue reached or exceeded 350 pages; the December 1983, at 393 pages. Even the second largest, the November 1983 issue, fell short of 350 pages, at "only" 344.

Although my collection only goes back to October '82 (vs. July '82 for yours), the December issue of that year did not even get to 300, and December is traditionally the largest issue.

<nitpick mode off>

Still, it would likely boggle the minds of 8-bitters who entered the world of computing after that era to see a magazine that large with no PC coverage.

In a message dated 3-27-95, Tim Irvin said:

"I hear a lot of references to Commodore monitors here.
Would any composite Commodore monitor plug into the 800XL
and provide color graphics *and* audio?"

SHORT ANSWER: Yes.

DETAILED ANSWER:

Suitable monitors would be the Commodore 1701, 1702, 1802, CM141, 1080, 1084, and 1084s. All support composite, split (chroma/luma) video, and audio. Additionaly, the 1701 and 1702 have the largest speaker, and the 1084s supports stereo sound.

The last three monitors not only support composite, but analog and digital RGB as well. They also have better dot pitch than the others, and are newer. Oddly enough, used 1802's generally go for about the same price as the 1080, and sometimes as much as a 1084 or 1084s. Used 1701's and 1702's are usually less, typically around $75 or less. Used 1080's should be $100 or less (I purchased on of mine for $65), and 1084's and 1084s' should go for about $125 or more on the used market.

Well, I wouldn't give up so easily. If we scream loud enough, maybe Atari
will hear us and declare all the software as PD. Someone is saying that
it is easier to get the software from a dealer. But that is because it
is still illegal to get it otherwise. If it was declared PD, I personaly
would get in a matter of days 2000 titles and put them on the net.
I don't have an 8 bit right now so there is no point of getting the software
for it now but if I buy it, I don't know. There is no place in Canada to buy
any software so the only logical solution will be to copy it from someone.

You totaly missed the point. Nobody is asking software companies to give
up the rights to the games. Just declare the 8 bit versions free to use and
obtain copy of. That would mean you are able to copy the game for your own
use or let someone get a copy from you without charging anything.

Well, if you have also 80X86 computer beside your Atari, you can get
this new gamepack from Microsoft with Atari2600 games in it. I've played
most of them and they are not bad even though 8 bit versions were in some
cases much better. There is River Raid, Pitfall, H.E.R.O., SeaQuest ...

I think Atari 2600 (using game carts like SNES, Sega, Jaguar do) was
sold as early as 1979.

ATARI 8-BIT SUPPORT FROM RICHARD GORE

My list of software for sale has now got quite long, so to save space and bandwidth I will just give a list of what I have got along with their prices, then if you need any further information you can simply e-mail me at chmrig@leeds.ac.uk and I will supply the information.

My range of commercial software:-

JAWBREAKER #4 ($9) disk, tape, Rambit tape 16k
MOUSEKATTACK #4 ($9) disk, tape, Rambit tape 48k
ARENA #5 ($11) disk, 64k XL/XE
BUBBLE ZONE #5 ($11) disk, 64k XL/XE
SUPER PRINT-LAB XE #6.95 ($16) disk, 128k XE
GTRACKER #6.50 ($15) disk, 64k XL/XE
BLACK LAMP * #4.95 ($11) disk, 64k XL/XE
TUBE BADDIES * #4.95 ($11) disk, 64k XL/XE

* available from 15th April 1995, advance orders are being taken.

Special offer (1); buy both Jawbreaker & Mousekattack in one pack for
^^^^^^^^^^^^^^^^^ only #6.95 ($15).

Special offer (2); buy both Tube Baddies & Black Lamp on one disk for
^^^^^^^^^^^^^^^^^ only #9.50 ($20).

Ex-stock, shrink wrapped commercial software. Limited stocks. You are advised to check stock levels before ordering:-

Disks: SUMMERGAMES #5.25 ($11)
DROPZONE #5.25 ($11)
SOLAR STAR #5.25 ($11) also known as Sun Star
CYBORG WARRIOR #5.00 ($10)
HALLEY PATROL #2.50 ($6)

ROMS: GATO #6.50 ($14)
DESERT FALCON #6.50 ($14)

HARDWARE: YORKY 256k plug in memory upgrade for 800XL. Plugs into PBI
-------- port, no soldering is required. Supplied ready for use with all RAM chips, manual and a disk of support software.
Last few units, priced at #50 ($90) plus p&p.

Prices in UK pounds (#) include p&p to UK, overseas add #2 for p&p, payable in pounds sterling or UK cheques, IMO, Postal Orders.
Prices in US dollars ($) include shipping to USA, but payment must be in US$ cash, sorry no cheques (checks).

For further information or to order contact Richard Gore at

79 SPROTBROUGH ROAD, SPROTBROUGH, DONCASTER, DN5 8BW, ENGLAND

Tel. no. (01302) 784642

E-mail: chmrig@leeds.ac.uk

Coming soon GTracker XL utilities, Golf Tour '95 and more.....

2748. Re: Should Atari software be PD? (was Re: Atari8-CD exists ???)

Newsgroup: comp.sys.atari.8bit

In article <3lci05$9a5@butch.lmsc.lockheed.com> ziggy29@rahul.net (Tim Irvin) writes:

>And if $2 is too much for a game, you must not really want it very
>badly...so how is not being able to acquire it an major issue?

That's an important point you mentioned - not everybody has a vendor around
the corner !!! I would have all cart's I could get for $2 (or DM 5,-)!!!
But especially old games on cart's costs up to 59,- DM (over 40$) here in
Germany, shipping not included - but this is not the major problem !

A lot of old soft isn't available (!!!) in countries in which the Atari
doesn't sold millions of computers (it's very hard to find even in Germany
second hand soft for reasonable prices !!!)

So I try to put my opinion in some short statements again :

1. Old soft should be avaliable on a server (maybe as shareware, too)!!!
2. Software that isn't supported and upgraded any longer should be also
avaliable on a server (I can't agree with the things FTe does - MAC65 on
which they don't do anything, cost's still 169,- DM here in Germany!!! And
SpartaDos is Shareware)
3. Newer soft (especially games), should be sold by vendors as they do to
keep the Atari8-bit scene alive !

I want to have a CD-ROM with all (or nearly all) the soft for our baby - not
because I like it to have software without paying anything (but I would pay
a lot for such a CD-ROM) but to keep the soft for the next hundred years !!!
What will be with your disk's in ten or twenty years ? A lot of read errors,
I could imagine !!!

So - and I don't want to put all the soft illegally to UMich, but how to ask
some softwarecompanies, programmers and so on to let there soft PD ? I'm
doing so here in Germany (all adresses are welcome) and here are so many
users - L E T S T R Y I T !!!

Matt

P.S. Notice - P.D. doesn't mean Freeware only, but also shareware, giftware,
cardware ...

: use or let someone get a copy from you without charging anything.

You are asking software selling companies to give up profits (small ones,
but still a profit) on Atari games.

It is this simple:

a) If you want "pirated" software, LOOK AROUND, it IS there....
b) If you have any sense of logic to anything, you would purchase
the software you wanted from the MANY stores that carry Atari8.

I don't understand why people don't see how ironic this situation
is! You wouldn't go around asking people to release Windows3.0 into
the public domain! (Go ahead, flame that point..try to make a comparison
between that and the Atari8.)

The software is STILL on the shelves. It must be purchased. PERIOD.

For X >= 3, actually...and if you want any kind of performance, make
X >= 4.

Only Windows could make a high-end 386 or low-end 486 slower than a 2600.

I think most of us, reffering to the software, mean games. So there is no point
of comparing Win3.0 to it. I wouldn't want to use any 8bit word processor even
if it was for free. The same applies to OS. But nobody is making new versions
of the same games every year or so.
And about the MANY stores? Last time I checked arround in computer stores
in Ottawa & Toronto, not a single dealer was selling the 8bit software for
Atari. And don't tell me to order it from somewhere. I like to go to the local
store and get the software not waiting for it in the mail.
Also, I can bet that every single one of you guys, who are against making
8 bit software PD, have at least one version of pirated software in your
collection. And don't start flaming with sentences like :
"No, not me, never, ... "

Well, I think Atari owes us all big time. I bought 3 Atari 130 XE computers
(2 of those I paid lot of money for), Atari tape deck, XF551 DD, Atari
printer, Atari 1040STE with monitor, HD, books and software. And now?
Nothing. That's right. Atari line of computers is dead. And please don't
try to argue with me on this one. Now I am happy 80X86 user who has some
good memories from using his 8 bit.
So I don't find it rude to ask Atari to make it PD at all. Who is with me?

I'm not sure if Nick Kennedy is still making cables, I think I recall in his blurb he only wanted $10 for the shareware fee, but $50 if you wanted a sio2pc in a box & that would include the shareware fee. I'm biased of course, but if you know how to solder at all I'd recommend you just use any inverter function in the place of the MAX232 chip. Bill's is running off a 4049 so he could use it w/o having to modify his 1200xl & I've made them from 74C00, 74HCT00, 74LS00. You just need to add a zener diode & resistor on the input from the clone to make the voltage levels right. In any event, it's less then $10 in parts & only uses either a 16 or 14 pin IC. I timed myself for the last one I made & it took me exactly an hour.

Er... WHY should they do this? So you don't mind if they keep all the rights to their software as long as they give it to you for free, eh? Yeh, sure.

Look, I well understand how difficult it is to find dealers who sell 8-bit software. Geez, it's hard enough to find ST/TT and Falcon software! But just because dealers are few and far between does NOT make it OK for you to steal the software simply for your 'convenience.' I sympathize with your plight but theft is theft and anything else is just rationalization.

Unfortunately, just because a software title is no longer supported is NOT justification for pirating it. The copyright still exists until the owner relinquishes those rights (or after 50 years!). It may not be logical or even fair, but neither is life. ;-)

Piracy is wrong. Period. If you MUST steal, then do so quietly, OK? At least have some courtesy for those developers who read these newsgroups.

Jason, for me there is so much more in the Ominmon & Omniview OS chips that I would never consider going to a straight 800 OS. For instance, a lot of times I get asked to do some USR(__) functions for people to use. If there simple, I just boot with basic & pop into Omnimon & use it's built in monitor/assembler to write the code. I don't use Omniview that much anymore, but I remember using it to do things like switch ramdrive to D1: for some software that would only run from drive one. Back when I used to spend a lot of time in basic, I would also use the 80 column mode for mini terminals or simple programing. Much more there then compatibilty. At least for my use, compatability was the lowest priority for the OS.

: soft !!!
: To copyright as whole : I think that all old Soft ('til 1990 or so)
: should be free and be available on UMich !!!
: I can't agree with the argument that some vendor's will cry then !!!

Everyone seems to have a rather simplistic concept on this subject. How could Atari release all 8-bit software to the P.D. if they don't own the rights to all of them? Even the ones they released under the Atari banner are not neccessarily theirs to do what they want. Take Donkey Kong for example. Atari doesn't own the rights, Nintendo does. When you have an old piece of software that was once wildly popular, would you just give up on it when the clamor about it has died down? Quite possibly, you would "sit on it" for a while and then release it as a new and improved version, or a totally different game using the same characters. That's what Nintendo did with "Donkey Kong Country". If they had released it to the public domain, they would lose any future stake in the entity.

Of course there are hundreds of programs out there whose status is in limbo. Bankruptcies, ennui, and the like have kept our programs in the dark, yet they are still someone's copyright. The problem is, WHO are these people and would they even care if they knew they owned the rights to programs that run on a "A-toy-i"? If you acquire the rights to programs for the T/S 1000 (ZX-81), would you go out of your way to release them into the public domain? Especially if you had no interest in computers at all?

2761. Help please.

Dunno if he actually uses it.

It allowed you to have 3 checking and 2 savings accounts. You could print
checks by purchasing a special holder. It might have supported
graphing--I don't remember. One thing I do recall is thay it was
s--l--o--w.

FTe to release MARS 8 in May!!

In article <hgx6XpL.ftooned@delphi.com> F Tooned, ftooned@delphi.com
writes:
>Well, The MARS 8 is finished, and will be going into production during
>the end of April. I will be showing a prototype in Canada, and hopefully
>there are people out there still interested in this "wonder-board" for
>the Atari 8-Bits. There have been a few minor changes, and I'll keep
>everyone here up to date as soon as the finished PC boards arrive and
>are fully tested...
>
>It's only about one month away, so if you are interested please direct

I'd like to know what a MARS 8 does. Maybe I'd be interested in a
'wonder-board' :)

kspear@ss0.eng.wayne.edu (Kevin Spears) writes:
>I'm almost ashamed to admit this amidst this diatribe, but I actually sent
>Ben Smith money, to purchase an 800 w/ a Bit-3 card and a happy 810 drive.
>He wanted $110 for both. That isn't totally unreasonable, is it? As soon

I paid $5 for my 800. I could probably get another one for even less. An
810 might be a little rarer, but I think $110 is way too much.

Source record: 92983

Ah, here we go again. Two months ago i wrote "COPYRIGHT?" and the thread was
pretty popular but i got into everyone's killfile becuz i was pro (in
regard to pd). So, i am not talking about that anymore, i just got a couple
of goos friends with lotsa soft, three hack BBS's numbers and i life is
a heaven. SO, you do it and don't even talk about it. IT IS DANGEROUS !

Edward A. Brunner (ebrunne@orion.it.luc.edu) wrote:
: Hi,

: I've just pulled out my old atari 400 (and 810 disk drive - still works!
: :) And now I was wondering if anyone has ever put together a complete
: cart list for the 400/800? Does anyone have any for sale? What about
: disks? I would love to get my hands on some old Synapse software
: creations (protector II, Fort Apocalypse, Shamus, Slime, Necromancer :D
: I've read the faq about getting stuff from the archive (confusing) and
: looked at the umich archive (doesnt seem to have any of the commercial
: ware , naturally, i suppose) Anyway, if anyone has any suggestions for
: some one who is just getting back into his original computer, they would
: be greatly appreciated!!

: Thanx!

: Ted B

If you want to get all those excellent Synapse games (you didnt mention
BLUE MAX!) you should try to get your hands on a C-64. It's got the best
versions of them, IMHO.

2767. Atari 8-Bit Computers: Frequently Asked Questions

its Maintainer, or the author of that section reproduced when given.

The Atari 8-Bit Computers Frequently Asked Questions List was created to
provide answers to many commonly asked questions found in the Internet's
comp.sys.atari.8bit/Info-Atari8 Digest/INFO-A8 discussion group. It is in
a constant state of development, and comes with no guarantees. If you
see any problems, I need to hear from you!

--- Where to get the latest copy of the 8-bit Atari FAQ List ---

The home of many FTP archive sites, automatically updated monthly:
ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/faq

The World Wide Web hypertext version, automatically generated monthly:
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/faq/faq.html

Alternate hypertext version, not as fancy, in Europe:
http://www.cs.ruu.nl/wais/html/na-dir/atari-8-bit/faq.html

Usenet newsgroups where this FAQ list is automatically posted monthly:
news:comp.sys.atari.8bit news:comp.answers news:news.answers

You can also get the latest version by e-mail.
mailto:mail-server@rtfm.mit.edu, message says:

5.3) What is the National Capital Free-Net Atari SIG?
5.4) What is the Closer To Home BBS?
5.5) How can I access the World Wide Web by Telnet?

Gopher
6.1) How can I retrieve files from the Merit/UMich Archive through Gopher?

World Wide Web
7.1) What WWW pages support the 8-bit Atari?

Prospero
7.8) How can I access the Merit/UMich Archive by AFS?

IRC
7.9) What is #Atari8?

Online Magazines
8.1) What is the CAIN Newsletter?

File Formats
9.1) What's this UUEncoding stuff (.uu, .uue files) all about?
9.2) What is an .arc file?
9.3) Okay, how about a .dcm file?
9.4) What is an .xmo file?

Emulation
10.1) What 8-bit Atari emulators exist for other computing platforms?

File Transfer Solutions
11.1) What are the best terminal emulators available?
11.2) Can I read/write 8-bit Atari disks on an IBM-PC?
11.3) Can I read/write MS-DOS disks on an 8-bit Atari?
11.4) How do I transfer files using a null modem cable?

Storage Media
12.1) What 5.25" floppy disk drives are available?
12.2) How can I use 3.5" floppy disks with my 8-bit Atari?
12.3) What do I need to connect a hard drive to my 8-bit Atari?
12.4) How can I use an IBM-PC as a storage device for my Atari?

General Interest
13.1) What's the best DOS for the Atari?
13.2) What hardware has Atari created in the 8-bit computer line?
13.3) What are the power-supply requirements for my Atari components?
13.4) What are the pinouts for the...?
13.5) What BBS software can be used on the Atari?

Other Documents of Interest
14.1) What vendors, developers, or publishers support the 8-bit Atari?
14.2) Where is my nearest 8-bit Atari BBS?
14.3) Where is my nearest 8-bit Atari user group?
14.4) How do I use my new or emulated Atari?
14.5) What prominent Atarians are reachable by e-mail?

Subject: 1.1) What is an Atari 8-bit computer?

In order of their release, the Atari 8-bit computers include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System. The 400/800 models were first shown publicly in November 1978 and first sold in 1979. The final machine, the XE Game System, was released in 1987. Atari Corp. officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

The following text was written by Chris Crawford and appears in De Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc., 1981-1982. It has been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM, ROM, and a (PIA). However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari

engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

ANTIC is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

GTIA is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missle graphics, and collision detection.

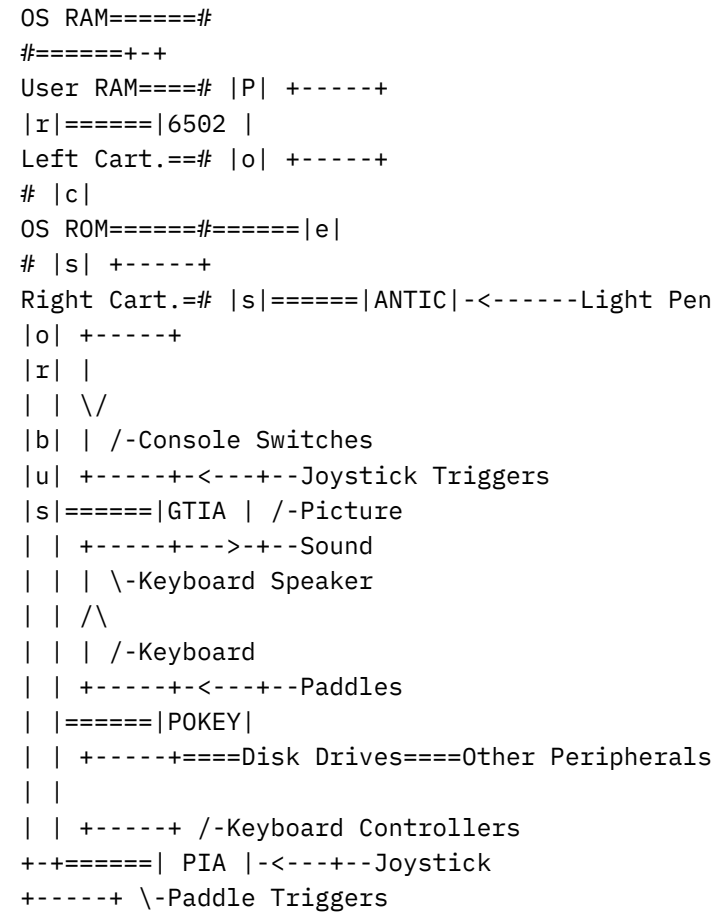
POKEY is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The 130XE and XEGS contain a small additional LSI called FREDDIE. According to mailto:masstorage@closer.brisnet.org.au (Masstorage), "Freddy is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. Freddy also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a freddy but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from freddy, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to freddy for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say freddy does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO freddy) and an extra 8 RAM

chips."

Hardware Arrangement



Beginners at using the 8-bit Atari platform may wish to contact Bill
Kendrick, mailto:kendrick@sonoma.edu, for his Newbie/Emulator FAQ.

The following is taken from Bill's Newbie/Emulator FAQ.
Graphics:
The Atari has maximum resolution of 320 x 192 (standard, non-overscanned
screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4,
160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also
supported. 40 x 24 x 256-character (128 normal, 128 inverse, character
set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allowed,
the other 128 characters have 4th changed into a color 5) and
40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only,
and 80 x 192 x 9 color screen modes.
Graphics Modes Summarized:
Mode Horiz.xVert.xColors text/graphics
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text

3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 4 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Normal (bordered), narrow (underscanned), and wide (overscanned) screen modes are available.
Screen modes can be mixed (by lines) down the screen using the Display List (a program which is executed by the ANTIC graphics chip every screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.
All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

Sound:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

[I'd like more system spec's here.]

Subject: 2.1) What is comp.sys.atari.8bit?

If you have Usenet newsgroup access you can access this discussion group through news:comp.sys.atari.8bit. This is an unmoderated newsgroup for discussion about the 8-bit Atari 400/800/XL/XE computing platform. All postings to news:comp.sys.atari.8bit automatically appear in the Info-Atari8 Digest and in INFO-A8.

comp.sys.atari was split into comp.sys.atari.8bit and comp.sys.atari.st in approximately 1986. To the best of my knowledge, there is no charter for comp.sys.atari.8bit, presumably because the custom of drafting charters for new newsgroups did not exist at that time.

news:comp.sys.atari.8bit is archived by the INFO-A8 listserv.

Subject: 2.2) What is comp.sys.atari.announce?

news:comp.sys.atari.announce is the moderated Usenet newsgroup for news items and announcements related to all Atari computing platforms. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari announcements. Moderated by Yat Siu from mailto:lexicor@world.std.com

---

Subject: 2.3) What is comp.sys.atari.advocacy?

news:comp.sys.atari.advocacy is the unmoderated Usenet newsgroup for advocating for or against the various Atari computing platforms. If you enjoy making comparisons between Atari 8-bit and other computing platforms, this is the place to do it.

Subject: 2.4) What is comp.sys.atari.programmer?

news:comp.sys.atari.programmer is the unmoderated Usenet newsgroup for topics in programming on the various Atari computing platforms, including the Atari 8-bit.

Subject: 2.5) What is comp.emulators.misc?

news:comp.emulators.misc is the unmoderated Usenet newsgroup for the discussion of emulating computing platforms on other computing platforms. All emulator discussion that does not involve the Apple][, the Commodore 64, or the WINE MS-Windows emulator (which each have their own emulator groups) may be found on news:comp.emulators.misc.

Subject: 2.6) What is comp.emulators.announce?

news:comp.emulators.announce is the moderated Usenet newsgroup for news items about emulating one computing platform on another. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari emulator announcements. The moderator may be contacted at mailto:emulators-request@qualcomm.com

---

Subject: 3.1) What is the Info-Atari8 Digest?

If you have Internet e-mail access you can access this discussion group through the Info-Atari8 Digest.

The Info-Atari8 Digest originates from

mailto:atari8@netcom.com

Subscription requests should be sent to the above address with the subject:

SUBSCRIBE | UNSUBSCRIBE (that is, one or the other)

The first line of the body of the letter should be the person's full name followed by his/her mailing address. For example:

Mike Todd snyder10@convex1.tcs.tulane.edu

To contribute to discussion threads in the Info-Atari8 Digest, send your posting to mailto:comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on news:comp.sys.atari.8bit and in INFO-A8.

Note that any posting sent to mailto:atari8@netcom.com will NOT be cross-posted to news:comp.sys.atari.8bit. The Moderator is presently working to correct this.

The Info-Atari8 Digest is archived by the INFO-A8 listserv.

Recent copies are also kept at ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jason Duerstock.

The Info-Atari8 Digest Moderator is Mike Todd, mailto:snyder10@convex1.TCS.Tulane.EDU

Subject: 3.2) What is INFO-A8?

If you have BITNET or Internet e-mail access you can access this discussion group through INFO-A8.

The BITNET subscription commands are:
tell listserv at marist register <your real full name>
tell listserv at marist subscribe info-a8

The Internet subscription command is:
mailto:listerv@vm.marist.edu, message says
subscribe info-a8 <your real full name>

To contribute to discussion threads in INFO-A8, send your posting to mailto:comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on news:comp.sys.atari.8bit and in the Info-Atari8 Digest.

Any postings sent to mailto:info-a8@vm.marist.edu or to INFO-A8@MARIST will not reach news:comp.sys.atari.8bit, so don't send your postings there.

You may leave the list at any time by sending a "SIGNOFF INFO-A8" command to LISTSERV@MARIST, or by sending a message to mailto:listserv@vm.marist.edu that says "unsubscribe info-a8". Please note that this command must NOT be sent to INFO-A8@MARIST nor to mailto:info-a8@vm.marist.edu.

The archive of comp.sys.atari.8bit, the Info-Atari8 Digest, and INFO-A8:

You can obtain a list of the available archive files by sending an "INDEX INFO-A8" command to LISTSERV@MARIST or by sending a message to mailto:listserv@vm.marist.edu that says "index info-a8". These files can then be retrieved by means of a "GET INFO-A8 filetype" command, or by using the database search facilities of LISTSERV. Send an "INFO DATABASE" command for more information on the latter.

Recent copies are also kept at ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jason Duerstock.

The INFO-A8 Moderators are:
HARRY@MARIST (A Harry Williams)
mailto:ravi@mcnc.org (Ravi Subrahmanyan)
mailto:billw@score.stanford.edu (Bill Westfield)

INFO-A8 was created on December 9, 1986.

Subject: 3.3) How can I access the Merit/UMich Archive by e-mail?

For more information on the Merit/UMich archive, see the section of this FAQ list on accessing this archive by FTP.

Downloading - BART

Brode's Archive Retrieval Thang - the Merit/UMich Archive e-mail file server

To learn about using BART to access the Merit/UMich Archive, send e-mail to: mailto:atari@atari.archive.umich.edu. The subject of the message doesn't matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes), try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the Internet) and splits up large files into parts of about 30K or less.

Uploading

Simply uuencode the file, (please split it into parts of 60 K or less) and mail the result to mailto:lenn@atari.archive.umich.edu. Please name

the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.

Subject: 3.4) How can I retrieve files from FTP sites by e-mail?

There are several general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet.

1) mailto:ftpmail@decwrl.dec.com with no subject line, and two-line
body with line 1 help and line 2 quit

2) mailto:ftpmail@grasp.insa-lyon.fr (body: help) Please, European
users only.

3) mailto:bitftp@pucc.princeton.edu (body: help or ftplist for a
list of anonymous ftp sites)

4) mail BITFTP@DEARN or to mailto:BITFTP@vm.gmd.de (body: help or
ftplist for a list of anonymous ftp sites) (Europe only)

Subject: 3.5) How can I post to Usenet newsgroups by e-mail?

There are a several 'public' mail/News gateways. Each one has their own
ways for addressing syntax. The three most common ones are:

Site: cs.utexas.edu
Syntax: newsgroup-name@cs.utexas.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp-sys-atari-8bit@cs.utexas.edu

Site: newbase.cs.yale.edu
Syntax: newsgroup.name-news@newsbase.cs.yale.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit-news@newsbase.cs.yale.edu

Site: decwrl.dec.com
Syntax: newsgroup.name@decwrl.dec.com
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit@decwrl.dec.com

Mail-to-news gateways of this sort tend to be overloaded.
Therefore, please do not use these gateways or any other similar
gateways if you can post to Usenet directly.

Subject: 3.6) How can I access the World Wide Web by e-mail?

Swiped from the WWW FAQ, which is maintained by mailto:boutell@netcom.com
(Thomas Boutell), here is how to access a web page by email:

mailto:server@mail.w3.org (preferred) or to
mailto:listserv@info.cern.ch (older address) containing
the following single line. (What you put on the subject line doesn't
matter; blank is OK. This line should go in the text of the message.)
You will receive as a reply a simple page intended to help you learn
more about the Web.

send http://www.earn.net/gnrt/www.html

Subject: 4.1) How can I access the Merit/UMich Archive by FTP?

The Merit/University of Michigan Software Archives hold a huge number
of files for many computing platforms, including the Atari 8-bit
computers. Our 8-bit Atari Archivist is Jody Lenn,
mailto:lenn@atari.archive.umich.edu; the Atari Archive as a whole is
maintained by Mickey Boyd, mailto:boydm@atari.archive.umich.edu.

The convention for Anonymous FTP sites is to accept "anonymous" as your
username, and your e-mail address as your password. All of the
FTP sites mentioned in the FAQ list follow this convention.

Downloading (Try the site nearest you first)
---
a) ftp://atari.archive.umich.edu/atari/8bit (141.211.120.11, United States)

b) ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit
(128.252.135.4, United States)

c) ftp://src.doc.ic.ac.uk/computing/systems/atari/umich/8bit
(146.169.2.10, United Kingdom)

(147.70.146.36, United States)

Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

Uploading

Place uploads in ftp://atari.archive.umich.edu/atari/8bit/New

No uploads may be made to the Archive's mirror sites.

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivist will be sure to place
it in an appropriate permanent directory.

Note that the 8bit/New directory is "write-only."

Newly uploaded items may be found in the 8bit/Newitems subdirectory.

Subject: 4.2) What is the Boston Archive?

Here's an 8-bit Atari FTP site located at Boston University. It is
maintained by Adam Bryant, mailto:adb@albert.bu.edu. This site seems to
have seen no uploads for years, but there are some files here that aren't
on any of the other sites.

ftp://cs-ftp.bu.edu/PC/ATARI (128.197.13.20)

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by Eyvind Bernhardsen,
mailto:eyvind@lise.unit.no. PVV stands for ProgramVareVerstedet, or The
Software Workshop, a student society at the University of Trondheim, Norway.

ftp://nova.pvv.unit.no/pub/Atari/8bit (129.241.36.207)

Uploads go to ftp://nova.pvv.unit.no/incoming/atari/8bit; Eyvind moves
them to the appropriate directory. Please include a .readme file with
each upload, so people know what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

This smallish 8-bit Atari FTP site is maintained by Kevin Atkinson,
mailto:kevina@clark.net.

ftp://ftp.clark.net/pub/atari (168.143.0.2)

Write to Kevin for uploading instructions.

A mirror of the ClarkNet Archive, kept by Jason Duerstock:
ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari 8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the Closer To Home Archive?

Here is a fairly large FTP site in Australia kept by mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears).

ftp://closer.brisnet.org.au/pub/archive1/8_bit (203.4.149.97)

Support site for James Bradford's Super 8-bit Products including SuperDos, SuperRam, Super800<->XL and much more.

Uploads go in ftp://closer.brisnet.org.au/pub/incoming

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

The Cleveland Free-Net is the hub system of the NPTN, the National Public Telecomputing Network. It can be accessed by any of the following: telnet://freenet-in-a.cwru.edu, telnet://freenet-in-b.cwru.edu, or telnet://freenet-in-c.cwru.edu (129.22.8.32 or 129.22.8.51).
Type "go atari" to reach the Atari SIG.

Those who add their names to the Atari SIG user directories are automatically members of the official Atari user group C.A.I.N. - Central Atari Information Network.

The Cleveland Free-Net Atari SIG publishes the CAIN Newsletter, maintains the CAIN Home Page on the WWW, and keeps the "Who's Who in the Atari Community E-Mail Directory" listing. Send correspondence and press releases to mailto:xx004@cleveland.freenet.edu.

Subject: 5.2) What is the Youngstown Free-Net Atari SIG?

Youngstown Free-Net (Youngstown, Ohio USA)
telnet://visitor@yfn.ysu.edu (192.55.234.27)

Type "go atari" to reach the Atari SIG. Write to mailto:xx140@yfn.ysu.edu for more information.

Subject: 5.3) What is the National Capital Free-Net Atari SIG?

National Capital Free-Net (Ottawa, Canada)
telnet://guest@freenet.carleton.ca (134.117.1.25)

Type "go atari" to reach the Atari SIG. Write to Christopher Browne at mailto:aa454@Freenet.carleton.ca for more info.

Subject: 5.4) What is the Closer To Home BBS?

Kept by mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears), this is a BBS in Australia which supports the 8-bit Atari.

telnet://guest@closer.brisnet.org.au (203.4.149.97)

Subject: 5.5) How can I access the World Wide Web by Telnet?

This section swiped from the WWW FAQ, which is kept by mailto:boutell@netcom.com (Thomas Boutell).

An up-to-date list of these is available on the Web as http://info.cern.ch/hypertext/WWW/FAQ/Bootstrap.html and should be regarded as an authoritative list.

telnet://telnet.w3.org
A telnettable browser provided by the W3 coalition.

telnet://www@www.cc.ukans.edu
Offers Lynx, a full screen browser which requires a vt100 terminal. Log in as www. Does not allow users to "go" to arbitrary URLs, so GET YOUR OWN COPY of Lynx and install it on your system if your administrator has not done so already. The best plain-text browser, so move mountains if necessary to get your own copy of Lynx!

telnet://www@www.njit.edu
(or telnet 128.235.163.2) Log in as www. A full-screen browser in New Jersey Institute of Technology. USA.

telnet://www@www.huji.ac.il
A dual-language Hebrew/English database, with links to the rest of the world. The line mode browser, plus extra features. Log in as www. Hebrew University of Jerusalem, Israel.

telnet://sun.uakom.cs
Slovakia. Has a slow link, only use from nearby.

telnet://www@info.funet.fi
(or telnet 128.214.6.102). Log in as www. Offers several browsers, including Lynx (goto option is disabled there also).

telnet://www@fserv.kfki.hu
Hungary. Has slow link, use from nearby. Login is as www.

Subject: 6.1) How can I retrieve files from the Merit/UMich Archive through Gopher?

The Merit/UMich Archive has a native Gopher server. Try

gopher://gopher.archive.merit.edu:7055/11/atari/8bit

to connect directly to the Merit/UMich Archive's 8-bit Atari directory. I personally recommend this method for downloading from the Merit/UMich Archive.

There are also several mirror archive sites with Gopher servers:

gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit

gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit

gopher://gaia.ucs.orst.edu:70/11/g-i-s/computer/zftparea/mirrors/archive.umich.edu/atari/8bit

---

Subject: 7.1) What WWW pages support the 8-bit Atari?

8-bit Atari FAQ and Vendor/Developer Lists, Michael Current
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/faq.html

Atari Classic Homepage, Eyvind Bernhardsen, mailto:eyvind@pvv.unit.no
http://www.pvv.unit.no/~eyvind/atari/

Atari 8-Bit Home Page
mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The Gatekeeper)
http://www.cs.vu.nl/~ipoorten/Atari.8bit.Homepage/index.html

Atari 8-Bit Resort
mailto:un55@rz.uni-karlsruhe.de, Marek Tomczyk

Subject: 7.8) How can I access the Merit/UMich Archive by AFS?

Downloading

Just cd /afs/umich.edu/group/itd/archive/atari/8bit
[What is the propsero:// URL for this?]

Uploading

Just cp the file into /afs/umich.edu/group/itd/archive/atari/8bit/New
[What is the propsero:// URL for this?]

Subject: 7.9) What is #Atari8?

There is a channel on Internet Relay Chat for 8-bit Atari users. Its
name is #Atari8. Join #Atari8 on port 6667 (EFNet) and enjoy (if you
meet somebody there).

There should be a small bot called XE_BOT on this channel. While on
channel #Atari8 use the command
/msg XE_BOT help
for more information.

The latest information on #Atari8 and the XE_BOT may be found here:
http://www.uci.agh.edu.pl/student/robo1grp/tatar/public_html/Atari/irc.html

Channel #Atari8 and the XE_BOT are the work of Tomasz Tatar,
mailto:tatar@student.uci.agh.edu.pl.

Subject: 8.1) What is the CAIN Newsletter?

The Central Atari Information Network Newsletter is the monthly online
magazine of the Cleveland Free-Net Atari SIG. The editor is Mark
Leair of the Atari SIG. 8-bit computers support is provided by Michael
Current and Craig Lisowski. For information, write to the Atari SIG at
mailto:xx004@cleveland.freenet.edu.

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
Merit/UMich: Archivers/uudecode.bas, Archivers/uudecode.doc
Boston: comm/uudecode.lst, comm/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
Merit/UMich: Archivers/yau.arc
Boston: comm/yau.uue, comm/yaue.uue, comm/yau.doc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
Merit/UMich: Utilities/uue.arc

Dumas UU-coder by John Dunning - should work w/BART-style split files.
Merit/UMich: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that is common in the MS-DOS world. This is done to make the file shorter, so it takes up less space on your disk and it takes less time to transfer between computers. The archives contains several 8-bit Atari archivers fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
Merit/UMich: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc
Boston: {comm,util}/superarc.uue, {comm,util}/superarc.doc

Subject: 9.3) Okay, how about a .dcm file?

A .dcm file is a format unique to the 8-bit Atari which is used to convert entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff.
Merit/UMich: Archivers/dskcom32.arc or Archivers/diskcomm.arc (same thing!)
Boston: {util,comm}/diskcomm.uue

Subject: 9.4) What is an .xmo file?

.xmo stands for XMODEM. The idea was that the file was not plain text, but was a binary file. As a binary file, it had to be downloaded using a file transfer protocol such as XMODEM. The use of ".xmo" as a filename extender was popular once, but has been discouraged for years.

Subject: 10.1) What 8-bit Atari emulators exist for other computing platforms?

These are the emulators that are usable.

1) ST Xformer 2.55, from Branch Always (see companion Vendor/Developer List for complete contact info). A freeware 8-bit Atari emulator for the Atari ST.

Merit/UMich: /atari/Emulators/stxf255.lzh

2) PC Xformer, from Branch Always (see companion Vendor/Developer
List for complete contact info). The 8-bit Atari emulator for
DOS/Windows/OS/2. Versions 2.0 and 2.5 are freeware; 3.0 is the commercial
version.

The following further info on PC Xformer provided by Bill Kendrick,
mailto:kendrick@sonoma.edu. Contact him for his Newbie/Emulator FAQ.

2.0 emulates an Atari 800. It requires about 300K of
free memory, 320x200x256 (MCGA/VGA/SVGA) graphics, and a 286 CPU.
It does not support ROM files, disk image swapping within the
program, player/missile graphics collision detection, sound,
PC joystick support, modem/printer support, but is free.

2.5 is the replacement for 2.0. It emulates either an Atari 800
or an Atari 800XL. It requires about the same as 2.0. It does
support ROM files and the PC speaker is used to emulate the old
Atari 400/800 internal speaker clicks. It is also free.

3.0 is the first commercial release. It emulates an Atari 800,
800XL, or 130XE (128K RAM; I heard it was to do 320K but I think
that was reduced). It requires a 386 and 512K of memory. It
supports Sound Blaster, player/missile graphics collision detection,
modem/printer and PC joystick support. It
comes with a disk with the software, an ammendum to the printed
documents, and a bunch of Atari 8-bit software (example programs:
demos/games, and a few useful utilities). It supports disk swapping
through a (currently) simple menu.

All versions support .XFD (Xformer disk) format disk images, and
all versions of PC Xformer support SIO2PC disk images (.ATR's).

PC Xformer 3.0 comes with a 36-page printed manual and reference.
It includes appendicies explaining graphics, sounds, colors, BASIC,
subdirectory paths (for MSDOS which in turn explains SpartaDOS/MyDOS),
a quick keyboard reference, ATASCII characters (all 128 drawn out),
the Atari editor, error codes, file IO (commands, devices, XIO calls)
as well as giving breif information on how to contact other Atari
users, common file extenders, and it includes a LARGE glossary
explaining Atari BASIC / TurboBASIC XL commands, Atari computer
terms, and general computer terms.

Merit/UMich: Xf2/xf2.zip, Xf2/xf25.zip

Of importance to PC Xformer users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into
SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

BobTerm 1.22, shareware by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; excellent for BBSing
Merit/UMich: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
Merit/UMich: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Combination VT100, XMODEM, Kermit; buggy at file Xfers
Merit/UMich: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Excellent at VT100 on the XEP80; 1200bps top speed
Merit/UMich: Telecomm/vt850b1.arc

FlickerTerm 80 0.37, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus

Merit/UMich: Telecomm/ft80v037.arc

Ice-T 1.0 by IceSoft (Itay Chamiel)
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: XMODEM download
Autodial: No
Backscroll buffer: yes (One screen)
Capture-to-disk: No
Summary: Excellent for high-speed VT100 emulation
Merit/UMich: Telecomm/icet.arc

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
Merit/UMich: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
Merit/UMich: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
Merit/UMich: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett and Mark Vallevand - The latest version!
Merit/UMich: Diskutils/myutil.zip
PVV: utilities/disk/myutil.zip

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
Merit/UMich: Xf2/anad207.zip, Xf2/anadisk.txt
Deana by Nate Monson - converts AnaDisk dump files from Atari format
Merit/UMich: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:preston.f.crow@dartmouth.edu,
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050 drive or equivalent. Very limited.
Merit/UMich: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 12.4), can be used to read/write to a hard drive connected to an MS-DOS system. This can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the companion vendor/developer list) allow the Atari XF551 disk drive to read 720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software Services (see the companion vendor/developer list), allows both low density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard floppy drives to be used on the Atari. A utility is included to read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on each computer. The RS 232 ports need to be connected together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. (Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25-pin port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the

confusion of the wide variety of serial port jacks on
different computers. Almost all computers connect into
the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An
850 Interface Module, P:R:Connection, Multi I/O, Black
Box (by Computer Software Services) or similar device
that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a
male DB9 to male DB25 modem cable to connect to your
modem. So why not use this cable as your null modem
cable as well?

For higher speed connections, above about 9600 bps on the
8-bit, you need the flow control lines. You also need
a Multi I/O or Black Box, which use the PBI (parallel bus),
then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C
port.
13 1
o o o o o o o o o o o o o
o o o o o o o o o o o o
25 14

(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed
but also pins 4 and 5 as well as 6 and 8. Or better
yet, make a true 25 wire, straight through cable and use
a commercial null modem. A commercial null modem is
just a small device with the correct lines already
crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

Subject: 12.1) What 5.25" floppy disk drives are available?

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- Ultra Speed - 70000 bps
Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps

- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- Ultra Speed (QMEG-OS, SpartaDOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 38000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2001
SS SD/ED/DD 19200 bps or 38000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2002
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS
CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel
DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European

==> SWP ATR-8000
Any standard standard except 1.2 meg and unique DS system
(HD) nice Z80 CP/M system in which CP/M drive acccess is parallel only
thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB
= standard SS/ED 130 KB
= standard SS/DD 180 KB
= 'cylindric' DS/DD 360 KB (XF-551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.

Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.
Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: My-DOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF-551 compatible)
Transmission modes:
- normal 19200 bps
- Top Drive 1050 70000 bps
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary;
full-compatibel with the SDX)
- Ultra Speed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the
XF-551.

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

- Amdek
- XF551 upgrades
- Floppy Board

==> Atari XF521
3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

Corvus ? 10 megabytes Fast but still relatively
slow I/O, kludge through
joystick ports for 800.
Rare
Supra/K-P N/A various Some limitations on drive
type and size and total
number of drives in sys.

FTe Multi I/O various 256 byter per sector
restriction. 256K and
1 meg ramdisk models.
Printer and modem, modem
will handle 19.2K bps
CSS Black Box various Will handle all SCSI drives.
Allows 9 drive access for
MYDOS. Currently the only
modem interface with CTS/RTS
hardware flow control. 19.2K
ready.
SWP ATR-8000 unknown limits Rare daughterboard for hard
drives. I/O is probably
fairly slow on this baby and
there may be DOS restrictions.

==> IDE/AT-BUS hard disk (still under construction)

Subject: 12.4) How can I use an IBM-PC as a storage device for my Atari?

Original by Dave Paterson, mailto:d.paterson2@genie.geis.com

SIO2PC is a cable and software combination that lets you use your PC as up to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to 16 megs. SIO2PC also lets you redirect the printer output to your PC printer or to a file on the PC. High speed drives are emulated (a la US Doubler).

All these functions are transparent at the Atari end; you never notice the difference between SIO2PC and regular drives, except that the SIO2PC drives are faster than any others (except Ramdisks and PBI interface drives).

SIO2PC 3.19i is shareware by Nick Kennedy.
Merit/UMich: Sio2pc/sio319i.exe

Of importance to SIO2PC users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g is disk-based; SpartaDOS X 4.21 is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/

developer list); MYDOS 4.53/4 is freeware from Wordmark Systems (Charles Marslett and Bob Puff).
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
Merit/UMich: Os/dos25.arc (DOS 2.5)
Merit/UMich: Fte/fte32g.arc (SpartaDOS 3.2)
Merit/UMich: Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Personal Computer (1979) 8-16K, membrane keyboard, 400/800 OS
800 Personal Computer (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16-64K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
800XE Home Computer (1987?)same as 130XE but 64K. Mostly eastern Europe.
65XE Personal Computer (1985) same as 800XL minus PBI
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
XE Game System (1987) same as 65XE plus Missle Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 Printer -40 col.
822 Thermal Printer -40 col.
825 80-Column Printer -req. 850
830 Acoustic Modem -300 baud req. 850, with Telelink I
835 Direct Connect Modem -300 baud, with Telelink II
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige & black metal versions
1010 Program Recorder -Sanyo and Chelco versions
1020 Color Printer -40 col., print/plot in 4 colors
1025 80-Column Printer -7-pin dot matrix
1027 Letter-Quality Printer-80 col., letter quality
1029 Printer -7-pin dot matrix, same as Commodore MPS-801
1030 Direct Connect Modem -300 baud, with ModemLink
1050 Disk Drive -SS/ED 128K with DOS 3 or DOS 2.5
1064 -64K RAM module for 600XL
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem -300 baud, with XE Term
XMM801 Printer -80 col. Ribbon: Mannesman/Tally MS80
XDM121 Printer -80 col.letter quality. Ribbon: Silver Reed CF130
XF551 Disk Drive -DS/DD 360K with DOS XE
XEP80 Interface Module -80 col. video display and DB25 parallel port

SX212 Modem -1200 baud, rarely with SX-Express! package

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1200 1200XL internally, many slight cosmetic differences
800XLF 800XL incorporating a FREDDY chip (as in the XE's)
1250XLD Earlier concept of the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL Earlier concept of the 1450XLD
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
1090 XL Expansion System-for PBI, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XTM201 -non-impact printer
XTC201 -non-impact color printer

Subject: 13.3) What are the power-supply requirements for my Atari components?

As with the rest of this FAQ list, please let me know if any of this information conflicts with the units you have. I'm also not sure how much of this section is valid outside North America. If it's not valid where you are, I need to hear from you!

The most important information is the voltage (in volts) required, and whether you need a transformer (AC output) or an adapter (DC output). The power (in watts) and current (in amperes) specifications of the original equipment as presented here should be regarded as minimum values. Higher-than-specified power and current capacities are entirely usable, and often preferable because such supplies run cooler and last longer.

Power (in watts) = current (in amps) * voltage (in volts)

9 V AC 5.4 VA (600 mA) Atari#CO62195 transformer:
1030

9 V AC ???? VA (??? A) Atari#CO61516 transformer:
1010

Subject: 13.5) What BBS software can be used on the Atari?

This section by mailto:winston@merk.com (Winston Smith)

Here is the run down of ATARI 6502 8-BIT BBSes that I am aware of:

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was
the first to support a RAMdisk, which Paul Swanson called a "V:" device
for "virtual disk". This BBS was written in Atari BASIC and required a
joystick hardware "dongle" device. This was notable as being one of the
first Atari 8-BIT BBSes that could actually go for a week without having
to be rebooted. Pointers to the message base were kept in an Atari "very
long string" (for which Atari BASIC is famous). The BBS would only have
problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of
the commercial BASIC XE cartridge to run. This BBS program was very
popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SpartaDOS environment. This was a problem
until very recently, when the disk-based version of SpartaDOS was
re-released as shareware. This BBS program uses a "modem clock string"
rather than an R-Time 8 cartridge in order to retrieve the current time.
It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE
cartridge in order to run. It is in the public domain and can import and
export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only,
control ATASCII graphics are reserved for message data-structure bytes).
FOREM-XE BBS is still currently in use as we speak, and may be reached via
the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in
effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM
terminal program of days gone by. I am not familiar with this program. I
think that it is written in Action! and only supports XMODEM Checksum
transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and
comes with a "dial out" screen so that the Sysop can use the BBS as a
terminal program to call and fetch files without having to bring the BBS
down and reload a terminal program. OASIS supports "Door programs" which
it refers to as "OASIS PAL modules". This OASIS demo module comes with an
excellent message system. The OASIS file system is one of the most
complicated that I have ever seen. It consists of "file libraries" with
suites of "file types". There is quite a bit of overhead involved in
performing a download (which may be a good thing, as it discourages file
hogs). There is a commercial version of OASIS called "OASIS IV" that

performs networking. There was an OASIS network between Boston, Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank Walters wrote it.

OASIS IV, CARINA, and BBS-EXPRESS-PROFESSIONAL! are all commercial programs. I haven't heard anything about OASIS IV and CARINA for a while, but PRO!-BBS is still a viable commercial enterprise last that I had heard.

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

1) See the "Atari 8-Bit Computers Vendors and Developers List." The latest version may be obtained in the following locations:

ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/vendev
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/vendev/faq.html

WHAT!? Wait a minute, the 800XL doesn't have F keys (does it? I don't have one!) How could an 800XL OS recognize keys not present on an 800XL?

Now,in Mapping I find that $60,$61 point to the definition table for the 1200 F-keys (an 8 byte table for F1-F4 and shift F1-F4, control F1-F4 are not redefinable.) intially at $FC11. The keys themselves are $8A-$8D in value and you can't assign a key it's own value. I assume the routines pointed to by this table do not exsist in an 800XL OS, (indeed, the TABLE doesn't exsist!) but are the keys read at all by the 800XL OS? if so then assinging functions to them should be simple, yes? I haven't had the time to pursue this yet, has anyone else?

Along these lines, since I have an 800XL OS IN my 1200 I assume I will have
problemns having the OS recognize the F-keys because of the different
keyboard decoder chips in the 1200 as well as the different OS.
Make sense?

From: jeking@xmission.xmission.com
Message-ID: <3lfk82$j59@news.xmission.com>
Source record: 93012

Has anybody out there successfully gotten SIO2PC to run under Windows 3.1
in the background?

I can partially get it to work in the foreground (full screen), but it
looses contact sporadically.

If I try to run it in the background (even with a PIF file), I get no
connection to it at all.

Any help greatly appreciated. I'd hate to waste the resouces of my 486
DX2/66 w/12meg RAM JUST to run SIO2PC as a stand-alone DOS app, when I
know its possible to get it to run under a multi-tasking environment.

May have to try DesqView next or something - unless somebody can help me
out here.

The Atari ST maybe, but the Atari 8 bits? I would have to question how "new" this software really is. Atari surely is not manufacturing copies of old 8-bit software. (it costs too much for something that won't sell)

> Many users will be much happier if Atari declared all the software as
> freeware.

I can't believe I just read this diatribe! First of all, it is very easy to get hold of original software. You simply have to get hold of the vendors/developers FAQ, decide who you want catalogues from, read whichever catalogues you receive, decide what you want to buy (yes. Nasty word, that, isn't it?) and order it. But noooo ... all this seems to be too complicated for some people ...

Okay, enough of the sarcasm. I'll agree that it would be nice if commercial software was available via Umich, for example, but the problem is that unlike on other systems, there are still quite large stocks available of old software, so there would be problems. People like Richard Gore and myself release old software when we can since some people actually prefer to buy originals (strange as it might seem to some ;), but we also write new stuff. Now then, if we supplied a particular program for say, three years, and for some reason we decide to have a break from the Atari and shut up shop for a while, after a few months some people might decide that we were no longer interested in the copyright of our own programs and dump them onto Umich.

So, what happens if we decide to return to the Atari after a few months and find all our software on the net? We'd probably be a little pissed!!

I may be stretching the point a little, but the thing is that if you want something to put onto the net, have some consideration for others. Some companies only sell stocks of old software and they are probably not going to bother if every Atari 8-bit title they sell is available for download.

There could also be a problem for suppliers of new software. With use of the 'net set to increase over the next few years, Atarians might decide to spend maybe 5 pounds downloading a piece of ex-commercial software, rather than order a 5 pound game by snail mail along with the shipping and tax that might be added on top.

If you are seriously interested in setting up a site for
ex-commercial software, bear two things in mind ... the wishes of the
copyright holders and the wishes of the Atari 8-bit suppliers. First,
check with several suppliers as regards to stock levels for a
particular game. If just one supplier has stocks, then you will have
to postpone release of that game onto the 'net for a while.

Secondly, ask the copyright holders for permission. I know that one
of the UK's largest software houses, Ocean software, have said that
they don't mind their Spectrum software being made available over the 'net,
and I've seen one site that contains a couple of Ocean's Spectrum
titles. Also, Vectrex games and information is available over the
'net just so long as you can burn your own EPROMs.

So just have a bit of consideration and don't just think to yourself
'what they don't know won't hurt them', because there's every chance
that they will find out.

New as in unused--not new as in "just produced." There still are some
people, by the way, *developing* for the 8-bit. Sure, the big names in
software publishing abandoned the 8-bit years ago, but other individuals
have taken the torch and are doing it now.

There is plenty of unused, commercially available software for the 8-bit.
Granted, there are probably some titles which are not available, and I
have no moral opposition to copying *these* titles, provided that you've
at least *tried* to find a commercial source (and if you buy it or
discard it if you *do* find a commercial source.

Ben, when it comes to function keys, the 1200XL and the 800XL OS both handle them fine! You CAN pop F-keys into an 800XL and you CAN use your 1200XL's F-keys even if it has an 800XL OS. Just try a Control+F2 and see what happens! :)

: So I don't find it rude to ask Atari to make it PD at all. Who is with me?

It's not rude, you just won't succeed. That's all.

Only perhaps on a case by case basis for special projects at best.

Certain properties Atari is going to hold fast on for obvious reasons.
Star Raiders and Adventure for instance. Atari has plans for those
titles in the future.

Down the road a year or so when Atari finally slips into bankruptcy it
will probably be possible.

The mortal Vladimir Jancarek wrote:

: I think most of us, reffering to the software, mean games. So there is no point
: of comparing Win3.0 to it. I wouldn't want to use any 8bit word processor even
: if it was for free. The same applies to OS. But nobody is making new versions
: of the same games every year or so.
: And about the MANY stores? Last time I checked arround in computer stores
: in Ottawa & Toronto, not a single dealer was selling the 8bit software for
: Atari. And don't tell me to order it from somewhere. I like to go to the local
: store and get the software not waiting for it in the mail.
: Also, I can bet that every single one of you guys, who are against making
: 8 bit software PD, have at least one version of pirated software in your
: collection. And don't start flaming with sentences like :
: "No, not me, never, ... "

Now you've gone over the line. Piracy can't be validated by laziness.

Even when Antic and Analog was still being sold on the stands (thus providing national mainstream coverage for the platform) the distribution network had eroded to the point where you really couldn't buy anything besides games in the stores, so you HAD to buy mailorder.

The last time I saw application software for the Atari8 in a mainstream place must have been early 1984!

Things haven't been easy for a long time all the way back when the Atari was still an item.

I never would have supported piracy for that reason back then, and I think it's a lousy reason today.

I think that publishing source code about the OS and citing Mapping the XL/XE stuff is perfectly okay because it has noble goals in mind.

But I think if you want something that the remaining suppliers have, you should buy it from them. Pirates suck anyway for anything but no-brainer shootemups because you don't get any dox.

Plus, used software is so dirt cheap, you could probably post a WANTED on the newsgroup and people would practically GIVE away their muliples of stuff they've collected.

2781. NEW graphic adventure game

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-31 00:00:00 UTC
From: bleroy@ccr.jussieu.fr
Message-ID: <1995Mar31.105709@ccr.jussieu.fr>
Source record: 93022

A few years ago, with three friends, we released a graphic adventure game in
french. Its name is F.R.E.E., which doesn't mean I'm ready to give it for free.
Since then, this game has been entirely reprogrammed (from scratch) redrawn and
translated in english (by people who speak better english than I do ;))
So what we have here is an adventure game with:
- 100 full screen graphics 15 pictures
- 1000 words of vocabulary
- a good syntax analysis
- a graphic user interface with windows ans menus: 95% of the game can be
solved without touching the keyboard
- automatic mapping (you can even go from one place to another on the map
itself)
- fast RAM game saving
- complex but not insoluble problems
- help where necessary
- 5 disk sides filled with images and programs
- a sense of humour

So let me ask a few questions:

Is anybody interested by such a game for the atari 8 bit?
Would you be ready to pay $20 for it or do you think that all atari 8 bit
programs should be free ;) ?
Would you be interested in other NEW games for the atari?

What I have in mind is this:
I will release a demo version of F.R.E.E. on the net. People who like the game
can then buy it from me.
If I get what I would call a reasonably good feedback (understand enough money) I
will continue my current project on the Atari 8 bit. On the other hand, if I
think that there is too much work in comparison with what I can expect from you,
I'll simply stop the project.
This seems reasonable to me. Don't hesitate to tell me what you think.

bye.

2782. My Indus 'bout to bite the big one

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-31 00:00:00 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.950331150126.18564B-100000@PEAK.ORG>
Source record: 93023

My Indus GT is sick. It had been sitting unused since around 1988 (so the previous user told me). Seemed to work alright a year ago when I tried it last (briefly...apparently too briefly), so I brought it down to school to do its duty. Sadly, it's *barely* cutting the mustard.

It groans SO loudly. I'm going to pull it apart and drop some oil off the dipstick of my Chevy on the rails and see if that will quiet it.

The biggest problem is it's so damn unreliable!!! I just tried to duplicate my ANSIterm disk and it took about 5 tries to get it to work. It went through that little routine that Atari drives do while formatting and having to re-try and start over. I don't know much about drives, but I conjecture that when it makes it many tracks and grunts and starts over, it's trying again. Eventually, it got it.

However, when actually writing the files (using option "J" from MYDOS, it *always* gets to track 29 and NAK's out! I've tried several times.

Could this be a slipping belt? Is there an Indus repair shop still around? Will a new 1050 mechanism fit in there? (of course I'd have to hacksaw the door lever shorter to fit) Perhaps this sort of drive is best to be parted out....or chucked entirely.

<sniffle> And to think I left a couple good drives at my folks house thousands of miles away because I thought it would be cool to stare at the digital LED track readout! Does anybody have any suggestions? Anybody have a dead Indus to marry with this one?

Thanks for any suggestions you may have <heavy sobbing>

James

2783. Wait! Maybe Bob Klass!

Newsgroup: comp.sys.atari.8bit
Date: 1995-03-31 00:00:00 UTC

Source record: 93024

Maybe Bob Klass can fix my Indus!! I forgot about him.

He's a nice guy, and does 8-bit work reasonably. Sadly, I remember a thread saying that he "Went to PC." I believe he's had PCs all the while, but does that mean he has ceased to support the 8-bit entirely? This all may have been discussed in the aforementioned thread, but alas somehow I missed the gist of that thread. :(

Seems like he told me that Indus itself was still doing repairs, but I may have misunderstood him. Sadly, it seems that after 2-way shipping plus shop fees+parts (Bob Klass excluded), perhaps it is not economical to repair.

I can't actually remember when actually was the last time I put a piece of Atari equipment in the metal container at the curbside, but it was with watery eyes, hat in hand, and flag at half mast. I hope I don't have to do it again.....:(

Can someone tell me the number for the Repair Shop BBS? That's the only way I know how to get ahold of Mr. Klass. If the board is down (since he allegedly 'went PC'), anyone know if he is still in the Atari business (before I pester him).

Thanks again.

James Wood
(3000 miles from home, stranded with shoddy hardware!)

Source record: 93025

Guess what else I brought down from Alaska for my use? A 130XE.

I brought down a mess of my favorite ROMs, and to my surprise, what do I get when I put in Donkey Kong? A blue screen and a READY prompt.

Figuring it must be dirty or something, I took 'er apart for inspection and a good cleaning. (I always disassemble every 8-bit I have to wash the case and keyboard (once apart) in hot water and cleaner so it's like new again)

The cartridge slot wasn't dirty....the prongs that stick into the motherboard (technical minds: please forgive my crude terminology) had been actually cut!!! I noticed on the bottom label (of the computer), someone had written "320K upgrade!!" - however, SpartaDos RD.COM identified this machine as a stock 130XE. If it was upgraded to 320K, the RD.COM would have called it a 256K 800XL, right?

Anyway, the RAM appeared to be stock in visual appearance - no piggybacking. That is, unless the 320K puts "bigger" (again..that terminology) chips in the same positions as stock and is therefore undetectable to my layman's eye.

WHY?? WHY??? What would possess someone to do this? I still remember the guy I got it from. When I go back to Alaska, someone remind me to punch him in the nose....for doublecrossing me, and equally for defacing an Atari!!! Maybe the guy got tired of the kids taking his BBS down to play PAC-MAN on ROM....heh heh heh.

Methinks its time to experiment (kludge) with a soldering iron, since my equipment is so decrepit. I don't suppose a cart. slot could be as difficult as a RAM upgrade. Must be time to get one of those vacuum desolderers and a soldering iron. Techies: What kind to get for an operation of this type? PLEASE!!!

Cartridgeless salutations!

James

> I've just pulled out my old atari 400 (and 810 disk drive - still works!
> :) And now I was wondering if anyone has ever put together a complete
> cart list for the 400/800?

Oooh! Almost. I was a bit bored last summer and started compiling a
list of known commercial Atari 8-bit software. I'd listed 150 ROMs
and a total of 2900 items of other commercial software ... mostly by
leafing through mags. Unfortunately, I've lost the file so I'll have
to do another one this summer ;)

Hmm ... This brings me a little question. I know that NTSC 2600VCS
carts won't run on PAL systems. Is the same true of Atari 8-bit
carts?

Actually, I guess not since people do import carts from the States.
Anyone know for certain?

David Wyn Davies
The Atari Classic Programmer's Club

It can only be justified, in my opinion, when there are truly and honestly
no commercial channels available to purchase the software.

>Even when Antic and Analog was still being sold on the stands (thus
>providing national mainstream coverage for the platform) the distribution
>network had eroded to the point where you really couldn't buy anything
>besides games in the stores, so you HAD to buy mailorder.

I saw some Atari8 stuff as late as about '86 or '87, but your point remains
valid. Of course, I live in an area where there are Atari8 retailers
practically in my back yard. But that doesn't change the general case.

>The last time I saw application software for the Atari8 in a mainstream
>place must have been early 1984!
>
>Things haven't been easy for a long time all the way back when the Atari
>was still an item.

I know...when I had my first Atari8, I watched around '83-'85 as everything
became Apple...so I bought an Apple and then everything became IBM...
forget it. I'm sticking with my Atari8 now. I'm tired of keeping up with
the Joneses...er, the Gateses.

>I never would have supported piracy for that reason back then, and I
>think it's a lousy reason today.
>
>I think that publishing source code about the OS and citing Mapping the
>XL/XE stuff is perfectly okay because it has noble goals in mind.

I'd also add that morally, I don't think copying commercial software is
wrong *if* the developers have no future plans to release it again on
that platform and if no vendors have any legitimate copies in stock.
But if the software is to be released again, or if vendors still have
copies available for sale, there is no justification for piracy.

>But I think if you want something that the remaining suppliers have, you
>should buy it from them. Pirates suck anyway for anything but no-brainer
>shootemups because you don't get any dox.

Bingo. Here is the key. Even if I *could* get commercial software for free, I'd much rather pay $5 to $10 and get the original box and dox. If I can't even pay $5, I don't really want the game, do I?

>Plus, used software is so dirt cheap, you could probably post a WANTED on
>the newsgroup and people would practically GIVE away their muliples of
>stuff they've collected.

True. People selling systems often have many software titles which are basically "throw-ins" to the deal. If you buy the entire system--usually rather cheap--you can then sell off the hardware you don't need and still essentially get the software virtually for free. Legitimately.

In fact, someone recently *did* give me a perfectly good 850 with an SIO cable and power supply...for only the $6 shipping charge. There are a lot of good folks here who want to keep the Atari8 alive, and encouraging new entrants (or re-entrants as many of us, myself included, are) to become Atari8 enthusiasts will help do just that. In a sense, I suppose we're trying to create an environment where 8-bit software and support are still available, and expanding the user base by practically giving away surplus stuff (or selling it for peanuts) does that. Our love of the 8-bit and our desire to see it thrive fuels the generosity.

Somehow I doubt that making all old Atari software freeware would attract new 8-bit users. It might increase the "ooh, ooh, free games" sort of fellow who would overdose for a week or two and then go off in search of free games for other systems, but that's all. For the most part, that's what emulator users are doing.

The Gore Demo, indeed! I am Richard Gore and I believe there has been
a bit of confusion, yes I uploaded a demo to the archives at Umich
but it is called The GTRACKER DEMO DISK, certainly NOT the Gore Demo.
For one thing I didn't write the demo, and for another thing I have
never even hinted that it should be called the Gore Demo.

I hope that sets the record straight.

Has anybody actually downloaded the GTRACKER DEMO DISK yet?
Do you like it?
I will shortly be uploading a demo version of a commercial game that
i sell, its called Arena, and the disk will be the Arena Demo. I
hope that stops any confusion before it starts.

I'm glad that Mr S.Lai (I hope its Mr, if not I'm sorry!) is happy to see Tube Baddies and Black Lamp. I hope most people will be!

With regards to reviews of the software, James Hague (I hope thats correct - my memory is failing me these days!) has been in touch with me and has offered to do a review for AC and a small publication called Video Magic, so keep your eyes out for those mags and read just how good the software is.

The author of Tube Baddies is also working on trying to get a screenshot using PCXformer, although without much success. Is there a way to do this? Neither of us have access too a video digitiser so video digitising is out of the question!

You can lubricate the rails just fine with 3n1 Oil or something of that
nature. I use to just clean the rails, put oil on a cloth and wipe then
down. Makes the drive run really quiet and will help with the life of
the unit as well...

--Todd--

James Wood (jamesw@PEAK.ORG) wrote:

Tim is indirectly supporting my plea. If Atari soft was made freeware, many
users (as Tim said) will buy software anyway because they are collectors.
I am not a collector, I am user/player. I want to try them all (games).

So send the order via certified mail. If they signed for the order, the
chances are better that you can recover or still receive your merchandise.

>-Other time I didn't get exactly what I asked for.

Then return it. Or pay by credit card when you can so you can contest
the charges if this gives you no satisfaction.

>-People on this news group complain about getting software without manuals
> through mail order.

Again--call them and ask if manuals are included. Get their names and if it
doesn't have the manuals, tell 'em you want the manuals. Again, if you can
pay by credit card, you can return the items and contest the charges.

>-It takes a long time and you waste time getting money order ...

It takes me about ten minutes. If you can't invest ten minutes, then again
I ask: how badly do you really want this stuff?

And none of the things you mentioned would be a major problem if you
pay by credit card. No stolen money orders, no time out to obtain one,
and you can contest charges if you didn't get what you were promised. And
don't *assume* you'll get docs with everything. Most mail-order vendors
do have all packaging, and those that don't are usually clearly labelled as
"no box" and/or "no docs."

>games I've finished without manual. Actualy, I haven't found a games which
>couldn't be played without a manual (except copy protection). I find it more

>fun playing without a manual and lots of them are badly written anyway.

Fine--but that's not the whole point. Many of us are collectors as well as enthusiasts. Collectors want boxes and documentation, even if they *don't* need them. I hardly needed dox for my Pac-Man cart, but I paid an extra $2 so I could have them. I bought a Star Raiders cart from American TechnaVision last week for $2.50 when I already had *two* of them--because I wanted the documentation. And I certainly didn't *need* the dox to play Star Raiders, either. (So now I have three Star Raiders carts.)

And if you find it more fun than playing with a manual--more power to you. But it still is a minority position, I imagine, and that isn't a justification for piracy. Anyone who doesn't have the documentation for Ultima III or the Infocom classics, for example, is being cheated. These docs are a joy to read in and of themselves whether you ever get around to playing the games or not. (And ATV also has many Infocom games new and complete for only $3!)

>> Plus, used software is so dirt cheap, you could probably post a WANTED on

>> stuff they've collected.
>>
>Dirt cheap? From the prices I see here, I wouldn't call it dirt cheap.
>$5 is OK but some charge over $10 up to $20.

Yep. I'll confess that I paid $29.95 for one 8-bit game a couple of months ago.

And if enough people didn't think it was *worth* $29.95, the price would be much lower. I get more play value out of most $10 Atari8 games than I do with DOOMDOOMDOOM^H^H^H the current $50 DOS/Windoze games. Just because software doesn't have state-of-the-art graphics and require 8 MB of RAM doesn't mean that the games are less playable or that the effort required in producing them is tremendously less deserving of support. In fact, I find the converse to be true--quite frequently, the huge megagames of today are often too complex and large to really be enjoyed by an enthusiast who wants to devote time to many different software titles.

Tell me the reason why would you return? Only because you like producing
software for 8 bit, not because you're making your living doing it.
Otherwise you will be programming for 80X86, Mac or UNIX platforms, am
I right? Of course I am. I wouldn't mind making soft for Atari for
FREE if I had necessary HD & SW.

Why is it that soft for C64 is freeware? That is probably the most important
reason for me to see all 8bit soft freeware. I can get games like
Boulderdash, Montezuma's Revenge and practically all games for 8bit (except
perhaps the ones made by Atari) for free from many sites on the internet.
So why would I pay for a game which the other guy gets for free for his/her
Commodore legally?

But it could stop some defections. I could easily see someone leaving
the Atari8 fold because of frustration with having very little support
and few sources for software.

HI !

I've read everything that was written her about sio2pc, but i still have
no idea how to get one.
First of, i am gonna buy a drive with just SIO cable, so the
question is should i buy SIO2PC or should i make it myself ?
If i should buy it then where ?
If i should make it then:
1) Wher do i get the scheme ?
2) WHat part do i need ?
3) where do i get software for PC and ATARI ?

I have 800 and 130xe

Help will be appriciated

Laziness is the last word for describing my unwillingness to mail order.
Let me give you some reasons for not wanting to mail order:

-Last time I ordered software from Toad Computers, my money order got stolen
when the store was broken into.
-Other time I didn't get exactly what I asked for.
-People on this news group complain about getting software without manuals
through mail order.
-It takes a long time and you waste time getting money order ...

> But I think if you want something that the remaining suppliers have, you
> should buy it from them. Pirates suck anyway for anything but no-brainer
> shootemups because you don't get any dox.
>

He, He. I have to laugh at this one. You will be surprised how many complicated
games I've finished without manual. Actualy, I haven't found a games which
couldn't be played without a manual (except copy protection). I find it more
fun playing without a manual and lots of them are badly written anyway.

> Plus, used software is so dirt cheap, you could probably post a WANTED on

I don't want to start an OS war right here in our cosy Atari world, but
have you thought of switching to OS/2? I haven't tried it yet, but as
soon as I get my SIO2PC built, it will be the first thing I try. I know
it runs Xformer 2.5, even in a window, without any problems, so I think
it should be able to do SIO2PC.

Let me know how it turns out!!!

James, I only know this because I own three of the games. :) Fisher Price games are some of the best games out there (suprisingly).

BTW, the serial numbering schemes are the same for each except for the last three letters. Those are the letters for the system they belong to (i.e., Linking Logic for Atari 8-bit is LLL-ATR and for Colecovision is LLL-CV).

Oh well, you know what they say about a sucker and his money..

Actually, I was able to get an 800XL, 1050 (stock), touch tablet, avatex 1200 modem, and some misc. software at a garage sale for $5. Which is a good deal (don't try to tell me I got ripped off THAT time! :) but none of that is stuff I WANT, like a bit-3 card, or a happy 810. Actually, I think back to the days when I could barely afford a 410 cassette recorder (I think it was about $120 in 1982) and the STOCK 810s were like, $600+, and $60 doesn't seem that bad!

2813. Re: 41256 DRAMS

Source record: 93054

blMe too! I just got a lot of mods I want to try (one to bump my 600XL to
bl256K with very complete XE compatability!). One thing I noticed in this
blupgrade, even for the 64K upgrade of the 600XL it is reccomended to cut a
blreconnect several of the address lines to the multiplexer chips (U5 & U6
bl),
blit is claimed that the 800XL address the memory slightly differently than
blthe 600XL, this fixes that. Anyone heard of this?

I know that for a fact. A14 and A15 are not connected to the multiplexer
chips. One must restore them to get 64k going internally. the order in
which the address lines are connected to the multiplexer chips is a
little different as well however this doesn't effect anything. Also the
74x32 chip must be removed and a jumper inserted in to 2 pins in the now
vacant socket.

Mostly to Vlad, a little to Artem. If you become a regular reader of this group, you will notice that there is a collective personality that seems to come out. We have are own hierarchy of life forms where the king of the jungle is the software writer/producer of classic games. This is followed by people known for their hardware expertise such as Bob Puff & Bob Wooley. Next in line would be people who are known for producing games/articles for Atari magazines such as James Hague or Norman Lin. Because of my personal interest, people like Dave Paterson or Richard Dell make the group a joy to read because of there knowledge experience. Probably a tie for them would be the people that maintain the FAQ list & the digest as well as the archive at Umich. I drop into B&C Computer visions on a semi regular basis & frequently BS with the owner(s). I also appreciate the efforts people like Richard Gore trying to continue bringing software titles to the market.
Now assuming my list is more or less valid, some people may switch relative positions depending on their personal interest, what is there about advocating piracy in this group that you can see is inconsistant with it's values? We really like having an environment where these people can come in and feel comfortable and maybe tell a few stories about the way things used to be. Since everyone has a vested interest in Copyrights, <Glen S. You're even into video arts right?> what would make you think we'd be interested in changing the status quo? I've been in the .CBM sig where everything is free/stolen & I find there is probably less support then the Atari sig. The concept of doing things the C64 way is just not appealing to me. You're entitled to your opinions, I just want to make sure you know they are falling on deaf ears. They're also a little inappropriate in this group, it's equivalent to showing up to a temperance meeting with a 6 pack of beer.
Specific to Artem; I seem to be the only guy with enough free time & soldering iron to make SIO2PC cables. I have given them away free on a number of occasions & next week I well be going to a local hospital where somebody needs one for a project to hook severly handicapped individuals to Atari computers. Now after several months of you paddling your boat against the stream I am now able to point out in a very real sense a consequence of your actions. You are going to have to waste a day figuring out how to make the cable or pay someone ~$50 for it. I won't offer to make one for my usual free or parts+shipping. I hope you've gotten your monies worth of pirated software, but isn't it funny how life seems to even out in the end?
Rick

You should adjust the Background Priority parm in the PIF file. Increasing it will give the program more CPU cycles when it is in the background.

If that doesn't work, you might consider switching to OS/2, which has much better DOS compatibility than Windows.

>

Yes, heres how: you get a cartridge copy program(copies cartridge data
onto a disk file) then get "The Translater" program(most long time Atari
users have a copy). Load Translater then load the disk file and you're
ready. Its not 100% but most of the time it works. There is also Atari
5200 cartridge copier interfaces that are used to copy Atari 5200 carts
to disk files, I have some files but still looking for the schematics
for the interface. good luck

>good memories from using his 8 bit.

Sorry, I am going to argue with you on this one.

So, you purchased several Atari computers and perhipherals, and
now you think your computer should be supported in perpetuity? Give me
a break!
My company pays hundreds of thousands of dollars for machinery,
yet they know that parts for it will be virtually nonexistant within
10 to 20 years (depending on the machine). At that point, if something
breaks, the machinery is just so much junk.
But in that time, they will have gotten value out of it, by
using it to make items that they will in turn sell. The machine will
have paid for itself.
You purchased a thousand dollars of computer equipment, got some
value (usage) out of it, and now it's over. you can still use it,
doing all the things you used to do with it (whatever that was, be it
gaming or programming, or using applications). You just can't have the
remaining software you don't own for free (not without breaking laws,
anyway).

It's nothing to complain about. If you didn't know this was the
case when you purchased the equipment, then I feel sorry for you.

So, what you are saying is that it is inconvenient for you to
purchase these games. Therefore, the games should be released into the
public domain.
That makes no sense at all. There are still people earning their
livelihoods from the sale of these games. If you can't get up the
energy to order games through the mail, that's your problem. The rest of
us seem to manage just fine.

I have to be blunt here. You are really turning me off with an attitude
like this. I think even those on this list (you know who you are) who
were flamboyantly proud way back when at their cracking and hacking on
protected software would not stand up publically and brag about it today,
in light of what became of the platform partly due to their piracy. Yet
you laugh as if it's a badge of honor.

: Dirt cheap? From the prices I see here, I wouldn't call it dirt cheap.
: $5 is OK but some charge over $10 up to $20.

You haven't been looking hard enough. Those who price their software too
high will HAVE to yield to the market forces.

It's a buyers market.

It's hard enough selling software for $0 to people who already have
everything they want, let alone charge $20 a piece for it.

I have some Atari 8-bit items that I may offer for sale if the market price and demand warrants. While I cannot put together a complete list right away (I will do so in the next couple of weeks), I can specify the following from memory (I just discovered this newsgroup so I thought I'd inquire right away about the potential to sell). I'm interested in what you think an equitable price range for everything below might be: Thanks.

1 Atari 800 (48K)
1 Atari 1200XL (64K?)
1 Atari 810 Disk Drive - Does not work but I have spare boards from a Happy Drive conversion. This MAY make it a working drive again, but assume it's for parts only.
1 Atari 1050 Disk Drive (works fine)
1 Atari printer (I'll have to check the model number. I recall it's a noisy little devil that uses an ink roller).
1 Star NX1000 Printer
1 Printer interface (I'll have to check the manufacturer/model)
1 Atari tape drive (I think the model no. is 410)

Every item above has its own power supply and all cables would, of course, be included. There is a "bunch" of software and manuals, but I'll have to open up the boxes to put together a proper inventory. At this point I'm trying to determine if its worth the effort. I do recall the following:

Basic (cartridge - in fact I recall there was two of them), Star Raiders (cartridge), Atariwriter, Necromancer, Space Eggs, Adventure, Zork I, Zork II (all disks - and I'm sure there are others), DOS and hardware manuals, and who knows what else.

At this point I'm interested in what the market value of the above might be. Assume everything is in very good condition with the exception of the 810 drive as covered above. Thanks for the effort.

: Make sense?
: bjcorr@delphi.com

All XL/XEs from the 1200XL on up have hooks for the F1-4 keys. It's just that the newer machines don't have F1-4 on them. There are hardware hacks explaining how to add physical F1-4 keys for the non-1200XL machines.

The exception here is the MUX OS. 1200XL (or 1400XL) users who install a MUX OS will lose most of the functionality of the F1-4 keys because the MUX OS remaps things like Antic DMA disable to hotkeys.

Which reminds me, I'd love to ask Bob to kill the hotkeys on a custom MUX OS so I could use the F keys again... I wonder if he could do that fairly easily, or maybe someone else who knows OS programming could do it.

From: khaley@nova.gmi.edu
Message-ID: <khaley.796791492@gmi.edu>
Source record: 93067

I recently unpacked my old 130XE system, and everything seems to be in working order, except for the 1050. From what I can determine, I think the drive motor has gone in it, as it does not operate reliably anymore and has actually screwed up a few disks.

If anyone can tell me how or where I can contact someone for necessary replacement parts, that would be appreciated.

In any case, I am looking to purchase another 1050 drive and possibly 800XL or similar system. Please email me for offers if you are selling any of these items.

Also, I would like to know if any of you have Hover Bovver, Jeff Minter's classic lawnmower game. I believe my 1050 has fried my copy, and am looking to see if someone would be able to mail me a copy. I will pay shipping if necessary.

Thanks in advance.

/Kevin

Well I was just playing dropzone, which I didn't realise at first I had,
and I have to admit that I didn't like it. I think the defender cart from
Atari is _much_ better, although I hate the way the game slows with lots of
things on the screen about to kill me.

One little game I quite like is crossfire - I can't get more than about 6000
on this. Those little monster/alien things always get me around then.

Richard.

: in light of what became of the platform partly due to their piracy. Yet

I personally agree that piracy did affect the platform, but it wasn't the absolute downfall. What did cause the downfall was a better, faster, and more widely supported platform, the x86-platform. But one day it will too meet it's doom. And the x86-platform probably has more piracy than the Atari platform ever did, but it is still profitable for businesses, where if a company supported Atari today and their software was pirated to death then they would go out of business.

2831. ST<->8bit file transfers...

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-02 00:00:00 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <FDCQDGVDUp@stingray.manawatu.gen.nz>
Source record: 93072

In case anyone is interested, I have a cable which hooks up to the 8bit's joystick ports (ports 1 & 2), and connects with the ST's parallel port.

With the corresponding transfer program on each computer, I can send files quite happily between the two.

It's not fast, but it has a checksum, and files don't appear to be coming out corrupted, so if anyone's interested in it, please let me know.

I will be modifying the programs at some stage (when time permits), but at the moment they all work, they're just not as friendly as I'd like - and hopefully I can get a bit more speed out of them.

The cable is easy to make - you just need one switch (on/off type - I pulled one of an old "rapid-fire" joystick), 2 female DB9 connectors (for the joystick ports), a male DB25 connector (for the ST's parallel port), and some wire (something like 10 strand or so - I use 2 6-strand cables).

It only transfers files, any size - it transfers in 16K blocks, so you need to have at least 20K free when running the program (in basic).

Umm, any questions please feel free to ask. I've only tested this on my computers, but Richard Gore is (hopefully) going to test it for me.

The docs aren't the best at the moment - enough, but not exactly the world's greatest manuals. I just wrote them quickly - I know how the program works, so I didn't need them in the first place. I just did them in case anyone else would benefit from this program. For people who have an SIO2PC cable and DJ800XL for the ST (like SIO2PC for the IBM, but I think it looks like it's a better program), you probably won't need this, but - if you don't need all the features of SIO2PC, then you might like this, as I think it should be cheaper to make.

I could post the stuff here in c.s.a.8, but not everyone will want it, and I don't have ftp access (yet), so umich is out of the question at the moment, but if anyone would like it, please let me know.

Just wanted to return the help that people have given me here in this group.

Richard =8-]

PS. If I had access to a PC, I could probably write this thing for a PC, or any computer with a parallel port (i.e. most). If you have an Amiga or PC, etc. and would like this on your computer, I can send the source so that you can convert it to your machine. It's in GFA basic, and a small 68000 assembler routine, but I can give help and explanations if needed...

2833. Quick Fixes for disk drives...

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-02 00:00:00 UTC
From: khaley@nova.gmi.edu
Message-ID: <khaley.796855259@gmi.edu>
Source record: 93074

I've noticed quite a few posts regarding disk drive problems, so I thought I'd share some insights while trying to get my 1050 to work. This will probably work on other similar drives as well.

As reported in a previous post, my 1050 had become unreliable. It was very noisy, and most of the time it had difficulty booting up. Slow "boot error" messages were a common symptom upon booting up.

Well, I opened up the 1050, and did a little looking around. A few quick fixes made the drive operate almost like new. If you have experienced similar problems with your disk drive, you might want to try some of the following:

1. Clean the read/write sensor.

2. Lubricate the bars that support the read/write mechanism. I found that using a q-tip was best. Apply some oil on the q-tip and rub it along the bars. This alone made my 1050 whisper quiet.

3. Check the drive belt underneath. It may be half-way or all the way off. Work the drive belt back onto the motor. This may be a cause of unreliable disk reads/writes.

4. The flywheel may not be putting enough pressure on this disk to turn it sufficiently. I found this to be the case with mine. The small bar connected to the disk handle has a plastic flap which pushes down the flywheel when turning down the handle. It may be worn down. To fix this, take a small label (copy-protect labels work best) and affix a label onto the metal flywheel base underneath the plastic flap. Now, when you turn the drive handle, the flap will move down onto the flywheel base where the label is located, providing extra "thickness", thus giving the motor a better grip on the disk.

Due to these small fixes, my 11-year old 1050 works quietly and reliably again, almost like new. I hope a few of these suggestions are helpful to those of you who are experiencing similar noise/reliability problems with your drives.

/Kevin

Chances are, somewhere on the Internet there's a pirate site for Atari
software too, but just because it's on the net, doesn't mean it's
freeware. To my knowledge, no software publishers have released their
software into the public domain (or declared it freeware), so
downloading the C64 version of Montezuma is just as illegal as
downloading the Atari version (assuming you can find either). If
nobody will give you pointers to any ftp sites you can download pirate
software from, well, I guess you're just another lamer. Do0d.

(More about Artem.)
I got a copy of Artem's messesge I'd like to send to his sys admin at upenn. If Mr. King could tell us how to contact sysadmin at upenn, that would be a great help. Maybe about 15 people could send copies of Mr. Koutchin's message.
I figure Artem now has the sources to pirated software he was looking for so he doesn't care about this group any more. Maybe if he gets a little message from his sysadmin, he'll go over to C= and see what he can get there, they seem to pass all commercial software around.
I once said 'everyone' was welcome here. I guess in Artem's case, I'd make the exception that makes it a rule.

I have an adaptec controller and a Seagate ST 225 and I cannot get the HD formatted. Each time I try to format it I get wierd block errors on verify. I need to verify that my jumper settings are correct.

On the controller:

P,N,L,J,H,F,D,B are open

and on the PU R S
T block, the jumper is from R to S

On the drive:

The 1st jumper on the left is closed and the rest are open in the jumper block between the 2 connectors.

Oh yes, I am using a 256K MIO.

>: Well, I think Atari owes us all big time. I bought 3 Atari 130 XE computers
>
> Owes us? yeah.. as if there were some moral point to this...

Heh. Good one. :)

There's one more thing I wanted to add to this discussion. Your
mention of "moral" reminded me of it. No, I'm not going to type a
lecture on morals! Never fear. :)

Instead, it reminded me that this isn't a question of morals,
ethics, or right and wrong. I forget who said it, but someone said
"if we scream loud enough, Atari will release the software to PD!" or
something very similar. Sorry I don't have the exact quote or the
name of the person who said it -- you can go back in the messages and
find out if you are curious. :)

Anyway, the person who said that must live a very protected
life. Businesses don't do things just because people scream. They
do things because they see them to be in their own selfish self-interest.
So, if customers scream, that's one thing. But if a bunch of non-
customers (ie, people using 80x86's and/or Atari 8-bits, in the case
of Atari, Inc.) scream, they couldn't care less.

Instead of acting (which invariably costs money), the business
will chose not to act. Who knows, those programs could be worth
something some day. And if not, retaining the rights to them costs
nothing.

If you really want Atari to release this stuff to the public
domain, you have to get their attention by waving money in front of
its coroporate face. Either buy the stuff then release it (Yeah, I'm
sure you will), or threaten a boycott of CURRENT product, and show tht
you have the power to make it stick and HURT them financially.

Other than that, all the screaming in the world won't solve
this "problem".

-Joe

Ps: Gad, problem...as if this really matters. It amazes me how much
people seem to love inventing "problems", when real problems threaten
at every turn. Ugh.

: >the stuff I read in Mapping the XL.
: >
: >I guess I'd settle for separate F-keys, but I so love the original 1200XL
: >keyboard! :��
: >

Two options: If you have func keys, but your OS doesn't support them,
remap the keycode-->ATASCII table into RAM (either by copying the OS into
the 16K ram under it, or by remapping the table by changing the address
in $79-$7A to point to your own table in RAM. This will NOT work on a 800
(but 800s don't have fkeys!). Then you modify this table, offset by the
value you get in 764 when you press a fkey, to the ATASCII value of the
relevant arrow key.

Another option is to drill four holes in your keyboard, install buttons and
connect them. Jeff McWilliams posted the specifics about a year ago, it may
be at the archives.. Maybe not.

Just my 2 shekels,

-itay

Russ: The standard way of getting in touch with a system admin at any site is to just address the message to postmaster.umich.edu for example or upenn.edu in Artem's case. It has been my experience that every site has standard rules for particpation. Paraphrasing; no obscene language, no illegal activity, & no posting to inappropriate groups. Under the last heading I believe advocating piracy in a group that is mainly made up of authors, shareware authors, software authors, employed by the film industry, or otherwise employed in a technical field where intellectual property is important would probably qualify. One of my friends who runs a Waffle BBS's puts it this way. People that can't follow those rules are usually to stupid to set up there own site & even if they did, nobody would use it. "The system works."
BTW: My former boss, God rest his soul, was a UPENN grad. It's probably one of the finest schools we have in the US. Seems like they have their work cut out for them.

> FREE if I had necessary HD & SW.

Yes, I do write software for the PC. This makes the 8-bit my hobby, right? Where possible, I don't my hobby to cost me a fortune. If I spend 2 years writing a piece of software (my current project is 18 months overdue ;), and it works well, then I am not going to really want to put it into PD circles. I want to get some of my cash back from it. Remember that even today, it still costs people cash to produce 8-bit software despite the fact that it has become a 'home-industry'.

Disks have to be bought, hardware maintained (just had my drive serviced a couple of weeks ago), consumeables replaced, telephone and electricity charges paid for, etc ... it all mounts up. PD software in general don't have the same amount of time spent on them and this is often reflected in the quality. Sure, there is some commercial crap around, but a lot of commercial software is well worth the asking price.

> Why is it that soft for C64 is freeware? That is probably the most important
> reason for me to see all 8bit soft freeware. I can get games like
> Boulderdash, Montezuma's Revenge and practically all games for 8bit (except
> perhaps the ones made by Atari) for free from many sites on the internet.
> So why would I pay for a game which the other guy gets for free for his/her
> Commodore legally?

I doubt this very much. The situation with two sites that I know contain ex-commercial software is that the Vectrex site contains software that the original developers of the system have freely made available to the Internet. The Sinclair Spectrum site that I know of in France is a bit iffy. I immediately recognised two games in there, but Ocean software (the original publishers) had told the guy who apparently programmed them that they didn't really mind. As for the other stuff in the French site, I'm not sure.

BTW: One of the Ocean games on the French site is Head Over Heels, which eventually appeared on the Atari. It finally arrived 2 years after a

finished product was reviewed in a UK Atari 8-bit magazine!!

I've noticed that one of the Atari 8-bit FTP sites contains the Zork trilogy and other Infocom stuff. My question is, was permission granted? I know what you might be thinking - 'Infocom are dead and buried, so it doesn't matter'. This is partly true since they were bought out a few years ago by Activision, but Activision still have plans to increase the number of Zork games in the future on other platforms (and have already done so in the past).

I have to admit to liking the idea in principle, but the time may not be right. If you can find some software that's difficult (or almost impossible) to get hold of legitimately, then I'd advise that you contact the software house first and find out their position on this. If the software house has long gone, then I don't think you'll have anything to worry about.

Come to think of it, why don't you go ahead and do a survey? Ask the US publishers about it and see what their responsed are? If you find some (and you will) that don't mind, then let us know who they are. Again, though, some titles would have to be withheld from the Internet in consideration of Atari suppliers who currently have stocks.

It'll give you something to do since I don't think you're going to let go of the idea very easily ;)

2871. AR - The Dungeon question

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-03 00:00:00 UTC
From: smrgoodw@reading.ac.uk
Message-ID: <3lokt5$7qg@susscsc1.rdg.ac.uk>
Source record: 92909

I've played Alternate Reality The Dungeon, got to the "end" of the game with a vile, evil character. I decided to try again, but this time, being good. Several new characters later I have finally manage a level 5 character (Norman) who has made it into the Light Wizards guild.

I have heard about the Chapel Sanctuary. Norman isn't good enough yet to be given access to this place and I refuse to "cheat" - I would like to know if anyone has made it in there without having to mess around with the character via a disk editor. If so what kind of good things should I do? I've given everything to the Chapel including the corpses I leave behind. I pray regularly (hey, that reminds me has anyone ever got a result from praying?), attend a sermon every day, give money to paupers and never fight unless attacked first. It's hard but someone has to do it.

- Joel G.

2873. Atari software as freeware ... the last word (hopefully)

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-03 00:00:00 UTC
From: MBITDC9306@titan.newi.ac.uk

Okay, here's something I just found in one of the sinclair WWW pages.
It details the pitfalls of trying to put copyrighted software on the
Internet and most of it is applicable to what's been discussed here.

Enjoy ...

Dave.

The bugbear: Spectrum copyrights explained

The bugbear: Spectrum copyrights explained

By Chris Owen (tr95006@sable.ox.ac.uk)

One of the most frequently asked questions on comp.sys.sinclair and
the Fidonet Spectrum echo is: is it legal to distribute Spectrum snapshots?

The answer is: generally, no it's not.

This is why there are no FTP servers in Western countries offering
Spectrum snapshots. The archive at ftp.ijs.si exists because of two
things: patient administrators and a lack of a Slovenian law against
software piracy.

Why is this? As the statistics for ftp.ijs.si and ftp.nvg,unit.no
show, there is still a fair bit of interest in Spectrum stuff. Yet the
software companies aren't making it available either commercially
or as freeware / shareware, as Amstrad have done with the
Spectrum ROMs themselves. What's more, it's not really piracy,
say many; the companies are not making any money out of the games
and so aren't being defrauded the same way that copying (say) Doom
II would be ripping off id Software.

The answer is threefold. Firstly, as mentioned above, it's not
commercially profitable - these are companies after all, out to make
money. If they do not make money from Spectrum games, why
should they distribute them? The problem for the people who want the
games is that the amount of demand for them is in that region between
nil and commercial viability; in short, it's not worth the companies
making them available for the small amount of financial returns they
would get. (This of course is a further illustration of the generosity
Amstrad have shown - without their ROMs there would not be any
Spectrum emulators, or at least no legal ones.) And, of couse, many
of the people downloading ancient games from ftp.ijs.si would almost
certainly not be willing to actually pay for the things; a charge would
drastically drive down the demand.

Secondly, perhaps the thorniest issue of all is the legal one, described to me by US Gold as "an enormous can of worms". You might think that repeating a TV programme is a simple operation, but it's not: there are actors' fees, repeat fees, legal fees and so on to sort out. Similarly with computer games, particularly with the many licensed ones produced over the years (from Ghostbusters to Rainbow Islands). In many cases, the copyrights might be held jointly by the programmers; by the licensee (a film company, coin-op producer or whatever); or, as in many cases, by the receivers for vanished companies. The cost of untangling these legal knots would in many cases seem to be too great to make it worthwhile, quite apart from the difficulties in tracing receivers and programmers from long-extinct companies.

A third reason is that some of the few surviving companies - Rare (Ultimate), US Gold, Ocean, 21st Century Entertainment (Hewson) - are jealously guarding some or all of their copyrights for reasons of protection of intellectual copyright. Rare, for instance, have apparently refused to make their old games legally available in case they want to re-use the characters. Although this may seem unlikely at first, it is quite possible; the current rash of rehashed old games (Rare's own Donkey Kong Country, Graftgold's Uridium 2 and the Atari Jaguar Tempest 2000, amongst others) is a demonstration of this.

However, there is a ray of hope. Some copyright holders have explicitly agreed to let their games be distributed as PD or freeware - notable amongst these are Julian Gollop, author of the superlative Laser Squad and Lords of Chaos, Vortex Software and the legendary Gargoyle Games. Others have adopted a "blind eye" approach along the lines of: we don't want the hassle of untangling the legal knots, but we won't prosecute if you do distribute the games. (It should be said that this is something said more in conversation than in writing, for obvious reasons). This is a slightly riskier situation, but one that at least allows distribution of the games.

Having said that, there is no reason why many Spectrum games should not be re-released by the companies as freeware - that is, freely distributable but still fully copyrighted and banned from commercial resale (rather like the Sinclair ROMs). In many cases, the reason why they are not would seem to be simple inertia. I'm trying to goad a few into action, but so far I haven't had much luck. Any updates will be posted to comp.sys.sinclair and of course added to this page.

So, in the meantime, what should be done? If you really must distribute Spectrum software, it's best to do it on the quiet; as Terry Pratchett told me regarding The Colour Of Magic (the game) , advertising what is effectively pirated software would be like standing on a hilltop whilst wearing wet copper armour during a thunderstorm. The thing most likely to bring a crackdown on Spectrum snapshots is the companies feeling that they are being ripped off. As long as it's a few enthusiasts swapping odd files, they're not likely to worry too much; but if people start advertising

"500 Spectrum games for emulator - only stlg20!!!" (as seen in Micro Computer Mart...), or establishing UK bulletin boards along the lines of ftp.ijs.si, they are not likely to be best pleased.

You Have Been Warned...

There you have it. All written down nice and neat. I hope that this will now be the end of the discussions on the newsgroup. Anyone who wants to go ahead and set up a site dealing in ex-commercial software should now know what to do ... ask permission first!

Artem and others

Maybe if there are non-believers here that we (at least I) can get most of the software (games) for the Atari 8 bit, we can prove it. I can put the stuff together and post a list here. They can pick any title from it and I'll send them a copy of it. That would stop that wining about me not having access to the soft.

Pardon me, I'm sure I didn't mean to imply that you hadn't been to every single Internet site on the planet, checking for Atari 8bit 'warez'. I bet you just ran through all 256^4 possible IP addresses, right? Oh, and every possible port too, let's not forget. Using ftp and fsp.

I am looking for 3 or 4 used (or new?!) Wico Command Control joysticks. Those were the ones with the big red stick, and had a switchable trigger from a base button to the button on the stick top. It had metal switches - the base was about 4 1/2 inches square.

Thanks for your help - reply to af309@cleveland.freenet.edu

I find this entire thread totally amazing and nearly unbelievable.

To publicly offer copyrighted material just for the asking, with no sense whatsoever of right or wrong and certainly no consideration at all for the authors and/or distributors of this software, is quite simply disgusting.

Just because dealers are hard to find is no excuse for theft. Sorry.

How can you have so little self-respect? I really do feel sorry for you. I'm also quite surprised that other 8-bitters tolerate posts such as these that promote criminal behaviour. You don't have to put up with it!

: slow. Any help welcome.

: Vladimir
: vjancare@magi.com

Hey VLAD !

Actually i don't believe it ! you did not know how to do that ? YOu
are diminishing in my eyes, (just kidding) SO, here you go:

METHOD #1 (FUCKING SLOW)
Use two modems and two phone line , blah blah blah you know what i mean
METHOD #2 (THAT'S HOW IT MUST BE DONE)

YOu must get the following things:
1) atari drive 20-70 bucks (but you must already have it)
2) SIO2PC cable 50 bucks (but someonesaid that he could give it
out for free)
3) SIO2PC software (it is PD on the UMICH archive)

then just insirt all you dicks one by one and convert then into xfd (or
.atr) format. Then just upload it 1 I would do it if i had a dirve. My drive
fucked up 3 weeks ago and i still looking for a cheap one (shit, as a student
i run outa money every week)

if you have any question just email me.

Artem (i help to those who help me)

>
>Vladimir
>vjancare@magi.com

Tim for some basic lessons of economics. Producer selling price: $20.
Sells to : wholesaler. Wholesaler has expenses etc. Sells program to
retailer for $35.
Retailer must pay rent, salaries, cover cost of software that doesn't
sell, advertise, etc. Marks program up to $80.

If you don't like the free market, try living in the alternative.

And re: your pathetic attempt at a put-down: once you've released a piece
of software then we'll talk. Until then you're merely a pompous buffoon,
impressing no one.

I don't use kill files. But the drivel from two sources recently is
sorely tempting me.

Answer to the question:
Yes, any platform which is no longer supported by software companies.
That's what I ment. So I guess some of the above mentioned will be under
that category.

Thanks, I just wasn't sure of where to get the software. I might get a hold
of an extra DD so if I do, I let you know.
By the way there is also a third METHOD (a little crazy):

1) Record everything as a sound file from TURBO 2000 to a sound file.

Then the other user simply records it back onto tape. Isn't that wild?
I like this idea. We should try it sometime asuming you have tapedeck

with TURBO.

Yet another moron? I offered this to guys like you because I know that
you would of course delete the soft after you've seen that it is what
I said it is. I wouldn't do that to distribute software illegally, do you
seriously think I'm stupid? Maybe I would even make it corrupted, so
you will just see the loading screen or something.
Maybe I didn't say it clearly enough, sorry.

it is me, Artem Just wanted to make some general commets about the thread.

SO, firstly:

1. as you see Vlad, IT IS IMPOSSIBLE TO BE POLITE WHEN YOU POST IN HERE !!!!
Why is that so ?

going on

2. Well, may be some people are looking for a couple titles, but i want
the whole package. I have about 100 titles, and i want all 5000 or more.
What is it gonna cost me ? 10,000 bucks ? 15,000 bucks. I'd better go
and buy a VR system and P100.

next ...

3. ALL REASONS TO LEAVE THE WAREZ FOR ATARI AS *not pd* ARE NONSENSE BUT
LIGAL

here you go ...

4. ALL THE REASONS TO MAKE WAREZ PD ARE REASONABLE BUT ILLIGAL

Artem (just a Warez man)

Hello all,

I am trying to track down two games that were released for the 8-bit in around 1984 that were fantasy RPG... like Wizardry.

They were called Dunzin & Kaiv

I used to have them ... sold my system.. got back into it and now I want to get those games back but I can;t find anyone who has even heard of them let alone get them for me.

Anyone????

>>Could someone explain Sweet 16 some more. I've gotten incomplete info on
>>its potential for 24-bit addressable memory.

Here I go again.... sorry 'bout that.

The Sweet 16 is a simple circuit board - a 65816 on one side, a 65729 on the other. It replaces the current CPU. It comes with a MAE 95, an assembler for the '816 that has four versions: 6502, 65816 and X-cart versions of both. If you want linear RAM expansion, get a MARS 8. It will provide up to 4 megs and NOT be a PBI device.

How do I know this? Simple. Sunday afternoon I bought a Sweet 16 at the TAF show. I met Mike, met Kyle, and saw what they're doing. I am impressed. The MIO II was working fine, booting off an IDE drive (still a prototype, else I'd have bought one of those too!) FTe is Doing It Right. If they keep this up, I'm going to end up very broke... and happy about it. Little comments about other things on the back burner serve only to tantalize, and raise the occasional question (256k buffer for a SS/DD floppy?) Lots of neat stuff going down there. All the best and future success to FTe!

2928. Dave's Clean Out the Closet Auction

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-03 00:00:00 UTC
From: da_pate@pavo.concordia.ca
Message-ID: <3APR199503380528@pavo.concordia.ca>
Source record: 93100

I have far too much excess 8-bit stuff. My closet is overflowing. I've decided to limit myself, and so I'm getting rid of a bunck of duplicates and broken stuff. Rather than sell it off piecemeal, I've put it all together and want to auction it off. Terms of the auction:

(1) Everything is as is. There are descriptions posted, but caveat emptor applies.

(2) Shipping and handling _IS_ included. Neat.

(3) Deadline for bids is midnight, April 16th.

(4) I will reply to all bids via Email. All bids should be sent via Email.

Easy enough?

Starting bid is $30.
Updates will be posted periodically but will not include the full text of this message, though I will mail it on request.

I want this stuff to find a good home; I'm sure that at least some of it will interest everyone.

And now, the merchandise:

== HARDWARE ==
(1) 130xe. Keyboard replaced last year. ECI and cart port flakey. Soldered motherboard. NTSC. Includes power supply.
(2) 850. Dead. No idea why. Includes power supply
(3) PR Connection. R1: dead; R2: and P: erratic.
(4) 850 / PRC printer cable.

== SOFTWARE ==
(1) B-Graph. 2 disks. Outstanding graphics charting and statistical analysis program for the 8-bit.
(2) SIlicon Dreams. Three graphical adventures in one. By level Nine computing.
(3) Spy vs Spy. Two player fun. Find the plans and escape.
(4) Wargame Construction Set. Design and build your own war games. Tactical or strategic level.
(5) Blue Max. Best Zaxxon-clone ever made - even better than the 8-bit Zaxxon!
(6) Shamus: Case II. Find and set the bomb to destroy the Shadow, then escape.
(7) Silent Butler. A Bookkeeping Program. From Atari, for home use.
(8) Kennedy Approach. Become an Air Traffic controller. Program speaks!
(9) Dunzhin - Warriors of RAS. Early adventure game. Cassette and disk

versions.

(All software include docs, and is on disk)

== BOOKS ==
(1) The Best Atari Software. by Consumer Guide. Want to know what was hot in 1984? Check this book out.
(2) 101 Programming surprises and Tricks for your Atari computer. Lots of neat BASIC programs; good way to learn BASIC by studying programs.
(3) Computers First Book of Atari Games. Lots of games. Study source code for inspiration.
(4) Mapping the Atari (400/800 edition). Lots of writing in the margins. Index tabs. Complete Dec/Hex/ATASCII opcode chart taped in back. The Key Programmers' Resource.

>Rick
>
Hell, the disk I/O without DOS alone makes Omnimon invaluable. I have files
that load with Omni that DOS can't even load! The Ramdisk hooks are in both
Omnimon and Omniview by the way and make using a ramdisk a snap. Omni is a
GREAT tool.

2931. Atari wares /books 4 sale

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-03 00:00:00 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.950402235213.13306B-100000@PEAK.ORG>
Source record: 93103

Commodore 1084s monitor - Hooks to about anything. Works great; no screen burn-in whatsoever. This FABULOUS display is the best possible for hooking to the Atari 8-bit computer - with "split" composite (sep. chroma/luminance inputs), as well as regular composite (VCR), digital RGB, analog RGB (ST, Amiga, Jaguar). Includes cables for (1) 8-bit Atari, (2) Atari ST, (3) Amiga. You can hook it to an ST/Amiga *and* 8-bit Atari (or VCR) and switch between sources with a slider on the front! Asking $100 - a bargain with all the cables.

Indus GT disk drive- hokey and unreliable, yet it does work. Technical minds could probably get this fixed themselves. Includes SIO and power supply. Great for parts if you have another Indus to marry to it. Asking $5 (basically for my trouble to hunt a box and go to the post office - and to save it from a dumpster.

Atari 130XE computer - clean and appears like new outside, yet the cart slot needs to be replaced- someone (for some blasted reason) has cut the cart slot prongs (motherboard not damaged, however). Other than the cart slot, works great - $10 Includes p/s.

Atari XEP 80 80-col board - Looks like new, but malfunctions - the picture rolls on the screen as if the horizontal hold is off (to compare to a TV). Includes original box, p/s, manual. Free, but buyer pays shipping. Maybe an easy fix for you hardware types. Dumpster-bound otherwise.

Atari 850 interface module. This one includes BOTH printer and modem cables (always extra) and p/s and SIO cable. Works great! $10

AtariWriter-80 - new in box. Actually, box opened, but disk never even booted since XEP went south. Manual, disks, etc. $5

Animation Station - Touch-pad like device with some kind of MicroIllustrator type software, by Suncom. The Atari houses ran out of these a long time ago. I was saving this little Easter egg for when I have time, which I don't. THIS IS NEW IN BOX. SHINK-WRAPPED!!! Asking $15 for it.

Cartridges: (just cart, no docs or box unless noted, but I'm sure you can figure these old games out!!)

Rescue on Fractalus $2 (New in box with docs)
Flight Simulator II - $2
Caverns of Mars - $2
Pac Man - $2
Popeye - $2
Star Raiders - $2

Pole Position - $3
MAC/65 - $2 (yellow label, don't have extension disk (will in 2 mos.)
ACTION! - $2 (same as above)
BASIC XE - $4 (same as above two)
Missile Command - $2
Defender - $2
Music Composer - $2
Assembler/Editor - $2
Archon - $2
Frogger - $2
Joust - $2

Books: all in good shape, no tears. Some like new. Some rare??

Atari BASIC, self-teaching guide - $2 (pix of 400/800 on cover)
Atari Sound and Graphics, self-teaching guide - $2 (similar to above)
BASIC Atari BASIC - $2 (black, multicolored font on cover)
How to Use Atari Computers (tall/skinny little book) - $1
Compute's 2nd Book of Atari Graphics - $2
Atari 400/800 Diskguide (small book) - $1
SAMS Advanced Atari BASIC Tutorial - $2
SAMS Programmer's Reference - $2
Atari Graphics and Arcade Game Design - $5 (fabulous BOOK!!)
The Musical Atari (learn about music and Atari) - $2

Other books:

Microprocessor Cookbook (chip-by-chip technical comparison of (complete profiles) 8080, 8085, 8086, 6800, 6802, 6809, F8, Z80, Z8000, TMS 9900 SC/MP, TMS1000, CP-1600, RCA 1800, R6500, Intel 8021, 8048, 4040, TI SBP 0400, AMD 2901, Inteol 3002, Motorola 10800, etc. Details each chip including programming aspects, architecture, addressing, instruction set, etc. Great reference...paperback - $3

The 68000: Principles and Programming - $2

Don't like the price? Want to make an offer? Want a package deal?
I'M ALL EARS Send me email. buyer to pay shipping.

> try to argue with me on this one. Now I am happy 80X86 user who has some
> good memories from using his 8 bit.
> So I don't find it rude to ask Atari to make it PD at all. Who is with me?

Not me.

The problem is that you're so set upon getting Atari for screwing up
your bank balance and then leaving you in the lurch that you're not
bothering to consider what would happen to the current batch of
vendors if you got what you wanted.

Remember, you're not alone in feeling that way. Until recently, when
I bought a 486 PC (and a couple of times 10 years ago), I've stuck
with Atari through thick'n'thin. First, a 2600, then a
long-lusted-for 8-bit setup and finally an ST. Now, I've decided that
Atari can bugger off. I will NOT be buying a Jaguar! Nice machine,
but how do I know that Atari won't snatch defeat from the jaws of
victory again?

So far, I only know of one high-street chain store in the UK that
sells Jags. Actually, that should now read 'sold', since they folded
a few weeks ago. Hell, I could have bought a new Jag for just 80
pounds when they were clearing their shops! I would have bought one
then if I had any cash to spare.

Anyway, I digress ...

I'm not pleased with Atari, but at least I know who I'm targetting!

I was reading about the OS upgrade chip that lets you switch between
XL/XE os 400/800 OS and would like to get one but my questions are:

1) will it work with the 65XE and XEGS as well as the 130XE and 800XL?
2) does anyone have one? does it work well? anybody sell me one?

if it will work with the XEGS, i would really like to buy one from
somebody along with an xf551 (james, dont worry, i am still sending
you the hard drive stufF!!!)
this sounds crazy, but my main reason for wanting the 400/800 OS
ability is cause i MUST be able to play Gorf and Wizard of Wor!
thanks and help me find the XEGS and XF551!! (~$50)
also, want to buy cartridges, just about anything except the
educational stuff. if you have them forsale, please write.

very happy to be coming back to the 8bit BY CHOICE!

It doesn't matter what Atari does or says, it doesn't matter what the original
owners do or say....
ALl the software and hardware has been ABANDONED by it's original owners.
It has no mother or father, no one cares what happens to 8-bit items.
Those who still use it, own it.
The spirit of the Thanksgiving Day turkey is never going to return to claim
it's old carcass.
We can do anything we want to do with old 8-bit hardware and software.
No one else cares.
Charley

I'm sure even the biggest 8-bit companies are diversified in some way or another. That doesn't mean that the 8-bit is unimportant to them as a means of income.

If you went up to Brad Koda or the guys who own B&C and said "hi, you wouldn't care if I went around sharing pirated games would you, because you aren't really earning a living off your stuff" I think they would slam dunk you onto the pavement.

It's more than money, it's principle, and to them, it is enjoyable to be able to still be involved with the 8-bits even in a part-time semi-serious basis. Even someone like Bob Puff doesn't sit around waiting for orders all day anymore (unfortunately) but he does other electronics stuff. But he has publically stated that he will continue to serve the 8-bit community as long as he can at least break even.

To destroy their ability to at least tread water at the marginal level that they do would be very damaging to the morale of the 8-bit community.

Brainwashing? No. It's an understanding of basic economics. I won't try to cram too much information into the hatrack you call your brain. I won't argue that the free market provides you with (legal) alternatives. Essentially, I believe that people deserve remuneration for their efforts. If they demand too much, I as a free individual have the right to refuse to use their goods or services. But if I do wish to use them, I should pay the amount they want.

By your logic: Oh. Damn. 'Vettes cost too much. I'll just take one from the lot - who gives a damn about the dealers and manufacturers. There is no real difference between intellectual property and any other. It's just that computer software is (unfortunately) esay to duplicate.

Oh, and by the way, before ranting and raving, take the time to learn how your editor works. I don't really feel like reading old messages quoted in toto. By editing out irrelevancies the flow of information is greatly accellerated. But were I to edit out the irrelevancies of your posts, I'd be left with a header and a .sig.

What will happen when those few who still sell 8 bit soft run out of supplies?
Are the software companies going to produce more? NO! Maybe then, it will
be at least morally acceptable to start copying.

>
> They were called Dunzin & Kaiv

Yup. Heard of them but never played them. I know that they were sold
as a twin-pack in the UK by a company called Ariolasoft (part of the
Ariola records group). I'm not sure which company actually wrote them
since Ariolasoft wrote very few titles of their own. Most of the
stuff they sold were by Electronic Arts before EA set up offices over
here.

Perhaps you could try somewhere like B & C in the States.

You could always wait until someone put the games up on an FTP site,
though ;-)

Artem and Vlad please go away, you're taking up spacs that could be used for much better things and also wasting a lot of peoples time and money. You're entitled to your opinion, but you're not entitled to put your opinion into action by breaking laws and I'm also pretty sure very few people reading this newsgroup agree with you.

Atari don't own the rights too all the games sold under there name, it has been said before they licenced games from various companies. They also purchased games from various independent programmers, now I know of one such person, under his contract the rights to HIS games have now been returned to him the rightful owner. Oh and by the way I now sell these games for him, Tube Baddies and Black Lamp. I sell them at #4.95 (UK pounds) each which translates to $11 when you take into account the extra postage and money translation charges. If you ever see these games I'm sure you'd agree they are worth that much. Out of that I make very little money, perhaps #1.75 per copy, now that ain't going to pay my bills is it, but it will probably end up being spent at some other 8-bit vendor since I am a user as well as a vendor. Thus the money is circulated and hopefully the 8-bit can live on!

> seems your main concern is money and getting your precious 'cash'.

I see ... so you think you're better than me, huh? Okay. So who's
better? The guy who puts something into the Atari community, or the
asshole who steals from it?

I run things on a non-profit basis. Any cash I make is a bonus. You
should try it and see how far *you* get. I am planning to release my
own PD/Shareware products when I have some time. These will be
smaller, yet useful, programs. So if you think you know so much about
me, why don't I sell them and make more cash? First, I won't have to
spend so much time and effort on them, and secondly I doubt that many
people would buy what I have in mind.

One other thing. If you notice, most of today's PD software is
actually Shareware. Also, if you'd bother to take your head out of
your ass for a second, you'd realise that most Shareware authors
actually ask for registration fees that are more than the price of
comparative commercial Atari 8-bit software!

Again, this is simple economics. I'll leave you to figure out why
this situation occurs ...

> And about commercial software being worth the price, you 're wrong again.
> I've read this article in which one retail salesman admitted that somethimes
> the producer of the software charges $20 for the package and retailer
> sells it for $80.

Atari 8-bit? I don't think so. But again, you're showing your lack of
understanding of the real world. I've seen the price breakdown of
commercial software in general and it's not a pretty sight. If you
want cheaper software on other platforms (you can't get Atari
software much cheaper than it already is) then complain to the
retailers. In the UK, they have a markup of around 40% (that means
they receive 40% of the proceeds from each copy of a program sold).
The distributors get about 25% and the software house gets 35%. Out
of that, the software house has to pay for advertising, wages, and
royalties to programmers (who usually only get about 9% of the
software house's receipts from a game).

All --

I generally read this newsgroup on a daily basis and for the last couple of years have forwarded all the articles to GEnie for posting in their Atari Internet section.

Traditionally there have been some very good, helpful discussions ongoing in this newsgroup of benefit to all those interested in the Atari 8-bit.

Of late, however, it has become a pirates den, so to speak, replete with the foul language and common vernacular of that immature genre. I realize that this is primarily due to a very small minority, but they are also a very loud one, unfortunately.

As a developer myself, it is quite disheartening to see such bold comments promoting piracy in a public forum like comp.sys.atari.8bit. I agree that most of the old 8-bit titles are no longer being supported and that finding dealers who still sell 8-bit software is a difficult task. That still is no excuse for theft, however, and publicly promoting criminal acts is certainly not what this group was established for. I understand that software piracy will always exist but must you rub our noses in it? If you must break laws, you could do so privately or via a pirate BBS.

It is no longer worthwhile to cull the pirate and vulgarity trash from the newsgroup so as of today I am ending the Internet feed to GEnie as well as my subscription to this group. This will have no effect on you, of course, but thought you should know what has happened.

My apologies to those readers of this newsgroup who care about such things and my sympathies to those readers who don't.

Bye,

-Hutch- @ Fair Dinkum Tech

P.S.: Reply if you wish, but I won't be around to read it. Yeh, I know... 'good riddance.' Hey, I feel the same way too. :)

As anybody can see, this gentleman is getting very abusive (and irritating).
In a previous article he talkes about making cash and now he's giving
away everything almost for free. I am not accusing him of having multiple
personalities but he should be consistent in what he writes here.
I'm also glad that I'm not the a*****e who steels but just a user who
expressed his opinion. Now I know it was a mistake. If everyone who was
opposed to my opinion simply answered: "I don't agree with you ..."
this 'message war' would have never started.

Have a good day.

I agree on David's figures how much everybody gets from the sale of
software but that was the same point I was trying to make.
Funny thing is that if you order the same soft from the soft company
it costs you the same as if you buy it in a store (in most cases anyway).
But I still believe the retailer is charging too much. It is my opinion
and that's all.

> DT> that won't sell)

Although I do not give out legal advice by my trade, as I recall the previous round of Copyright Law, buying an original piece of software on media with a license agreement contained within the documentation betstowed upon the owner the right to use the product in execution upon his machine and the right to resell the original product. How the binary code was actually stored for use, and in what form, wasn't covered in the Copyright Law. You were purchasing the liscense to use the code. Ergo, if you had a fresh copy of the code on fresh media, but had not purchased the license to use, you are in violation of the codes' copyright when the code ran on your machine. However, if you purchased the license to use, you could transfer the binary code onto fresh media for the purposes of preservation. The term used was "archival backup".

"it costs too much for something that won't sell"

I wonder if executible archives could be stored on Compact Disk and a fresh disk and manual could be produced on an "on demand"/"just it time" basis with destination barcode label printed on the box to be scanned and machine sorted ? Heck, I have heard of "vanity" publishers that will run off a book from a textfile. Why not a "vanity" software house? MS-DOS, C64, ACORN, or ATARI ? Hmm... I don't know if you could have something like a "universal disk drive" to do the various file formats, MFM, GCR, etc., though. Oh well, I thought I might have had a good idea there for a moment....

Evyind; I think you've hit the problem, "so cute at this age" on the head. It's really hard to have anything but pity on these poor kids. It's amazing what they admit to. For instance, Artem says he's a finance major. Surprise surprise surprise! After 3 tumors I abandoned my career as a chemist to take a part time job with... Parmount's <the movie/entertainment guys> finance division. Paramount's now a division of Viacom, the Cable tv guys. Huge company so if he ever gets in a different area I'd probably never notice he's with the company, but still: Life has a way of evening out. Life's to short to waste my time worrying about stuff like this, but somehow I've got the feeling that Artem & Vlad will eventually grow up and at least learn to be a little descrete. At least take it to .advocacy where it belongs & leave us alone. I'll follow the lead <was it Heller's?> & no post in any thread these guys start & no responses to posts from them.
Rick

Joel; I managed to get exactly one character into the santuary legally in about two years of playing. I *think* he had to wait until he was 6th level before he got in also. What seems to happen is a lot of variables are just not high enough for every character you start to survive while being good. It really weeds out the weak characters fast. It is the quickest solution to the game though. You just stand outside the santuary casting Temporial Fuge until it's almost 100%. Everytime you get tired, you just go into the Santuary for a little food & relaxation, then back outside casting your alter ego's little heart out.

2961. Another Great Victory

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-04 00:00:00 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1995Apr04.205439.27375@wariat.UUCP>
Source record: 92894

So, my 4th 800xl went on the fritz. Came up with a white screen that went to a dark red screen. Ahh.... a chance to fix it! Got out my Sam's. Lemme see, 'Troubleshooting. Go to 'Clock and Dividers'. Get out my 30 year old Heathkit oscilloscope assembled by my mother and a logic probe. Waveforms. Spend three hours looking for the leads, cleaning up my work area (badly needed). Check for 3.579545MHz wave form at collector of Q8. Spend and hour looking for my old college physics book and find out what the 'collector' is. Emitter, base, collector, emitter points to base, collector points away from base. Check for waveforms, pin 29 GTIA, pin 34 Antic, pin 6 of U18, pin 11 of U18, pins 6,8,10,12 of U29 (Delay line). Nope all pulses present, wait there seems to be something more basic than just the video output. Backup to CPU checks. Says 'check the clock circuits first'. Already did that. 'Check for pulses on address pins of CPU, 9-20 and 22-25 and also the data pins 26-33). Ahh. No pulses. Beans, now what, no more instructions. Says something about Address decoder (U2), Memory Management Unit(U3), OS ROM and BASIC ROM. Hmmmm.... OS rom has solder flux on top of it and looks like it has gotten very hot (getting closer now.) Go to surplus store, pick up a 28 pin socket, suck the solder out and remove OS ROM, put in socket, put in spare OS ROM, try the computer. (OS ROMs cost $20 at ATV!) Now I get a blue screen with a cursor at the top. (All the while comparing with a good 800xl motherboard, pulses, screen appearance, etc.) Try the 'compare' mother board, looks same except it makes that nasty pblllllllt, fart sound and comes up 'READY'. Hmm... no Pblllllllt sound. Thats when the computer tries to boot, must be the PIA or Pokey. Pull out the PIA. In swapping LSIs (I always try this first), I put the PIA in with a pin bent. Straighten pin, put PIA back in, turn on and pblllllt... 'READY'. Another small achievement for Atari 8-bit, a great victory for a former anatomy teacher.

I don't understand. Are you under the mis-conception that Atari owns the rights to ALL software written for the Atari? Or are you just referencing the titles they DO own? Also, many of the packages released by Atari were done so under an agreement from other software companies. Atari couldn't release these to PD even if they wanted to.

Actually, you should sell your Atari and buy yourself a clue. Count me out either way with your dumb poll. Waste of time.

Picked it up "as is" at a thrift store and in this case,
"as is" appears to mean broken (at least the "as is" CoCo3 I
also picked up works *shrug*) I figured I'd try my hand at
reviving it, but I haven't the time now so it's just taking
up space...no major loss for me though, I still have my 800xl to
play with, only loss here is the 4 joystick ports (no 4 player
Asteroids =^(and the experience of typing on a rock^H^H^H^H
membrane keyboard.)

As it is right now, when you turn it on, while the
power LED doesn't light up or seem to produce sound (wow, internal
speaker...) when I ctrl-G, the "snow" on the TV does shift for a
moment (but continues to "snow")

Price? _$8.00_, what I paid for it, plus postage, or
maybe trade for games, any system, 2600 5200 7800 8bit Intv
Coleco Vectrex etc... (if you don't like that price, for a
"broken" machine, then well... shucks.)
This is the 400 CPU and power supply.

Source record: 92816

Somebody was talking about having software stored on a CD and then being copied on demand as required. Well a few years ago there was such a system here in the UK, it was called EDOS. Basically the store displayed a copy of the games available on the system, you picked what you wanted, paid your cash (about #3 to #4 per title) and waited while the machine copied and packaged it for you!

It did however have one or two drawbacks;

1) It was a tape based system.
2) Despite the fact that a lot of the titles available were available for the 8-bit Ataris the EDOS system didn't support the Atari. I think the reason of long tape lengths was given as their major excuse!

Why do I mention this? Well as far as I can see the system died pretty quickly. A lot of people abandoned tapes and moved onto other platforms, so I think the situation is still unresolved. Obviously it failed but would a disk version be popular and/or feasable economically and electronically. I really ask myself though is there a need for it. The original EDOS system supplied tapes for C64, Spectrum, Amstrad and MSX, now actually thinking about it I think disks were also supported, its been a while but possibly ST and Amiga disk might have been available. Today (in the UK at least) there are two disk formats in major use, PC (MS-DOS) and Amiga so is such a system worthwhile? I don't know and I'm starting to waffle so I think I'll call it too a halt there! Any comments, questions etc. Lets get back to making this group a proper discussion group.

This is funny. I stopped sending posts on this subject 2 days ago but some
people here are probably bored and have no other subject to write about
so they are returning to this 'freeware' again and again. Lets all try
to write about something constructive.

Just one more thing. There is many readers (some post here as well) who
e-mailed me asking for 'warez'. So should I count them as the ones to
agree with my opinion? Do not answer to this, I won't reply to anything
on this matter ever again.

>
>Zork nothing! Anyone remember what the goal is in Necormancer???
>What a strange game.

Yeah. You're this wizard-type dude, and you have this "wisp" and some trees at your disposal. The game is played in three phases:

Phase 1: You have several tree seeds and you must plant them and make them grow to full-grown size. Along the way, you need to use the wisp to place your seeds, to grab the funny-looking thing which gives you more seeds, and to take out the spider before it poisons your trees and kills them. When you run out of power, you take your then-current number of full-grown trees with you in phase 2.

Phase 2: With your trees, you descend down five levels of a dungeon-like thing. At each level there are ten "cells" containing spider eggs. The ones which are flashing are about to hatch! Move your trees to the spot above those cells when you can (being careful not to lose the tree or get power sucked from you). At this level, if you lose all your power, the game is over. When you position a tree over a cell, it will eventually fall through the cell and crush the egg...hopefully before it hatches and starts attacking you (which would drain power if you're hit). Once you make it past the fifth level, you go to phase 3...but the spiders you haven't crushed in phase 2 will be there to haunt you.

Phase 3: Here you are in a graveyard--five of them, actually, one at a time--meeting with the evil big guy himself, together with headstones and spiders. If you run out of power, the game is over. Every time spiders touch you, you lose power. You need to run over all headstones and make them disappear. Doing this will take you to the next graveyard (unless it's the 5th one already, in which case I assume the game is over and you've won) to do it all again. Hitting the evil dude with your wisp gives you a *big* power bonus. Do it frequently, while running over headstones and avoiding spiders.

I've made it to the 4th graveyard in phase 3, with a score of about 45,000 if memory serves me correctly.

I knew about such a system for music in Germany. I think if TURBO was
developed a little sooner for the Atari, that system would probably
support it and even Atari would of been most likely more popular computer
than it was.
In my opinion, regular diskettes (3.5", 5 1/4 ") are not a good idea.
Most of the software now takes many (10, 20, 30 and more) diskettes.
I can see it beeing popular in a near future when blank CD ROM's become
cheaper or flopticals become much more popular.

> ><> Steve Kulpa <><

The goals for each stage of NecromancerL

Stage 1: grow trees

Stage 2: Use trees to destroy spider eggs.

Stage 3: destroy the tombstones by walking over them. If you've killed
off all the eggs in stage 2, you'll have much fewer spiders running
around the graveyard.

I've only ever made it to level 4 in stage 3, and died horribly. Has
anyone ever made it to the end? I've heard rumours of a neat display.

>MIO 2?
>
>Ken Siders
>cp576@cleveland.freenet.edu

As the owner of a brand spanking new Sweet 16 (65816 board) I'll answer this. Fine Tooned Engineering sells the upgrade for $69.95. It's a compact circuit board that replaces the CPU. It comes with John Harris' MAE, with 64k and 128k versions for both 6502 and 65816 machines. (so even if you don't have an '816 you can still program for it!). Linear RAM expansion will be available with the Mars 8 board.

The MIO II is real and it works. At the Toronto Atari Fest ST owners were green with envy that cheap IDE drives could be run with an 8-bit. The model on display at TAF was a prototype board, but from what I could wee it worked flawlessly. Right now, it's software that needs to be finished. I was _very_ impressed. Mike wants to get things right, and so far he has.

2987. Atari 8-bit Omnibus

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-05 00:00:00 UTC
From: da_pate@pavo.concordia.ca
Message-ID: <5APR199513484006@pavo.concordia.ca>
Source record: 92828

The Atari 8-bit Omnibus is still available, now with a money back guarantee.
This ad-stravaganza filled with products for the Classic Atari costs only
$5 per copy. That includes worldwide shipping.

The Guarantee:
==============
If you don't like it/find it boring/think it's not worth $5/etc.,
just send me a letter with your name and address, saying what you
don't like. KEEP the magazine! I'll write back, apologizing and
including a cheque for your $5. Good enough?

Current Notes called it "...a nice piece of work...a neat idea..."

Comments on comp.sys.atari.8bit have included "Check it out!" and "Shell out
five bucks and get a copy of the Omnibus." Who am I to disagree?

So c'mon and try it!

The Atari 8-bit Omnibus
PO Box 342
Cote-St-Luc, QU H4V 2Y5
Canada

[Canadians can pay in Canadian funds. All others please pay in US $]
[If paying by cheque or money order, make it payable to David A. Paterson]
User group special pricing: $4 per copy, minimum order 5 (five) copies.

> (510) 352-3787

Will these mechs work in an Indus GT? Mine has a problem with the
track 0 sensor, and I'm getting tired of moving the head to track 0
every time I insert a disk. (Suggestions for fixing the drive would
be welcome too, since that $14.95 will probably be more like $50 once
you add shipping).

Works really nicely with Desqview, even on my twerpy little 8Mhz 8088.

By the way, I usualy turn Turbo off (for 4Mhz) since it stutters at 8mhz!
Very funny. But very frustrating till I discovered this!

And if anyone can teach me how to use the Ultra-Speed without Spartados,
I'd really be happy! (I have something called BeweDOS, which is Sparta
compatible. Will it do the trick?)

Will my PC fry if I kill the fan?

2994. Second try: Any diagnosis for this sick 400?

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-05 00:00:00 UTC
From: ziggy29@rahul.net
Message-ID: <3lv2h4$f6h@butch.lmsc.lockheed.com>
Source record: 92835

I posted this once before, but didn't get much response...maybe this time I can get some good information. Well, I can hope.

I lifted a 400 from a thrift store (paid $5 for cables and a power supply and the 400 came "free") recently, and it has an interesting problem. Here it is...I've learned a bit more about 8-bit hardware and stuff since my last note, so maybe I can give a more intelligent description.

If you don't need the keyboard, the 400 works just fine; for running cartridges which need no more than 16K, it's fabulous. With the keyboard, though, there's a bit of a problem. When you first turn the machine on, everything is fine--you either get the memo pad (if BASIC is not in the cartridge slot) or the READY prompt (if BASIC is in there).

At this time, you can start pressing keys on the membrane and all is well. Until, that is, you hit the RETURN key. When you hit the enter key, the characters somehow "morph" into others. For example, what used to be the letter "C" would then become some other ATASCII character--consistently. Every time I press "C," the same ATASCII character would be output. In fact, I don't think the problem is with the keyboard. Here's why:

The "shifting" of characters is not only on inputs but the *outputs* as well. The READY prompt becomes a different pattern of five ATASCII characters--the same each time. Also, I can type (on the keyboard) something like "? 22334" and then hit return, and something is *indeed* printed back--five characters, with the first and second being the same, as well as the third and fourth. Not only that, but the machine apparently recognized the command as a PRINT! So the keyboard is almost *certainly* not the culprit. (And the RETURN is always correctly interpreted as a RETURN.)

Could there be a problem with the chip(s) which provide the display? Something about hitting the RETURN key which makes it go bonkers, perhaps? It appears that the CPU is processing entered commands correctly; only the display seems to be garbled. Maybe something has happened to the character set? (Doubtful, since the characters returned are still always ATASCII.) What could possibly go wrong only when the RETURN key is pressed?

Would any of you suspect and of the main processors, such as ANTIC, POKEY or the CTIA/GTIA? I could get some replacement chips from ATV in my next order if this sounds like a serious possibility. (If you would suspect them, why? I'd like to be educated.)

I'd love to hack this thing (no big loss if I make it worse), but
I'd like to have an idea about where to start. I really don't need
this thing; I have an 800 and an 800XL. But it would be cool to
fix this thing...

3000. More interesting stuff on my sick 400.

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-05 00:00:00 UTC
From: ziggy29@rahul.net
Message-ID: <3lv9bl$nrh@hustle.rahul.net>
Source record: 92841

I was going to follow up my own note, but it's not even here yet!

If you saw my original note about my sick 400 character output, here's some more stuff I just discovered. The characters are being "converted" to other characters in some cases. Here's what I noticed:

ATASCII codes... are being displayed as...

0-63 0-63 (no problem)
64-95 32-63
96-127 0-31
128-191 128-191 (no problem)
192-223 160-191
224-255 128-159

Also, BASIC displays "READY" but then prints the garbled characters as above right away, even before the RETURN key is hit. Assembler Editor behaves similarly. Atari Logo lets me enter stuff, but when I hit the RETURN key it hangs up. (Does Logo require more than 16K?)

Note the characters which never appear: 64-127 and 192-255. All of the alphabetic characters are in here, so it's pretty hard to "work around" the problem since there's no apparent way to produce letters!!

I know that the Atari takes the starting address of the character set and applies a simple algorithm to find a given ATASCII character in memory based on its number. Could the routine which does this be garbled, and hence looking in the wrong places in the character set memory for this stuff? And where is that routine? Is it in ANTIC?

As Alice of the Brady Bunch would have said, it gets "curiouser and curiouser."

> $D700 - $D7FF Atari reserves for purposes of tests
>Does anybody know, what exactly happens (on PBI, cartridge slot or
>somewhere else) when writing or reading in this part of memory? Are
>there any devices, using these adresses?

From "Mapping the Atari"

D600-FFFF (OS-ROM)

This 10K of memory is the OS-ROM, containing the floating point package
the 2 built-in characters-sets, device handlers, CIO, SIO, IRO etc. It
differs from the older Atari's OS (800) so some older programs will not
load on XL/XE's. In these cases, you can use the translator disks such
as XL Fix which is public domain.

This area is also used by the PBI, when a device on the PBI is called,
its ROM is mapped into the D8XX area. The D6XX area then gets used as
device control registers and i/o block areas.

When I first saw the system in a local shop (I think they still use
it), I wrote to several companies - including Atari - to see if I
could get hold of some software to legally copy and distribute in a
similar way (albeit by mail order).

Although I heard from Daryl Still at Atari UK, who directed me to
Sunnyvale, I never heard from Atari US. So I think we can assume that
Atari aren't going to relinquish their software without a fight.

The port on the back of the SX212 is for using that modem on a NON-Atari 8bit machine. It will not allow
you to use it as an interface (unfortunately). The XEP80, however WILL allow you to plug a printer into it..

Does anyone know how to make an ARGV parameter vector array call using
DEEP BLUE C, ACE C, CC8 NO-NAME, or CC65 ?
Is an ARGV call even possible with these C compilers?

I notice that an ARGV call doesn't appear to generate a compile error of
any kind, but neither does it appear to work, either....

Is there an existing syntax for an ARGV call under these compilers, or do you
have to design your own parsing routine ? (If there is a built-in function
than I would rather use that, but there appears to be no mention of ARGV
in any of the documentation. This is most curious.... Anybody ? Thanks.

As far as I know, the 65XE has the same chips inside as a 130XE, but they're
all soldered, not socketed. The XEGS might be different.

3012. SOUPED UP ATARI ST FOR SALE

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-06 00:00:00 UTC
From: olias@telerama.lm.com
Message-ID: <3m0qte$5jt@epicycle.lm.com>
Source record: 92714

```
Souped Up Atari ST System
Prefer to sell as a system but will consider selling separately

Atari 520STm $200
- 4MB RAM (Tech Specialties upgrade board)
- Switchable Dual TOS (1.0 & Rainbow) (rear mounted switch)
- ICD 16MHz 68000 Upgrade (rear mounted Switch 8/16)
- DS/DD 3.5" floppy
- mouse

Atari SF314 DS/DD 3.5" floppy $40
Atari SC1224 Color Monitor $180
Atari SM124 Monochrome Monitor $90
Monitor Master monitor switch $15
Toadfile 44! (w/4 cartridges) $300
- SyQuest 44MB SCSI removable media drive
- Under monitor low profile case 2 bays
- ICD Advantage Plus SCSI host adapter w/ built-in clock
- Four (4) 44MB cartridges

DigiSound Professional (Sound digitizing
hardware & Software) $50
ADC 1200 Baud External modem $20

=======
$895

Will sell entire system for ..... $700
(C.O.D. shipping charges not included.)
Original packages software and documentation
included.

If interested, send e-mail or call Jim (412) 359-1763
Leave voicemail if I'm not in and I will return your call.

3022. Quest for 80 columns

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-06 00:00:00 UTC
From: ziggy29@rahul.net
Message-ID: <3m1lne$3gt@butch.lmsc.lockheed.com>
Source record: 92724

Okay, gang, I've got the interface, modem, and BobTerm in place.
BobTerm has been great for file transfers. What I really would like is
80 columns. I know of a few, according to the FAQ, which (if the
FAQ is correct) don't need an XEP-80. So far, I haven't been very
successful at using it for anything except ftp'ing software. And
have I been prolific at that! :)

First of all, BobTerm has its own 850 initialization program in
it which starts automatically when you boot it. The other comm
software packages I've tried--FlickerTerm and OmniCom--don't seem
to have that, and I don't have an 850 initialization program laying
around anywhere. Can it be found via ftp? On UMich, perhaps? And
what would it be called?

Also, I tried Ice-T 1.0, but when I followed the directions which
are given when you first boot up, I get a garbage graphics screen
which consists of pixels of many different colors, mostly bright.

In a nutshell--I want something which will run 80 columns and
emulate a VT-100 without additional hardware. And if the other
programs I've tried will work if I had the 850 handler, where can
I find it? I still have to use the Windoze box for my 'net stuff
(except for ftp) since all the mail and news software seem to want
to format everything in 80 columns for the VT-100...

>Does it prove anythinh to you ? Sure it does to me

It proves that you should do what I'll bet most of us here do--try to find something at a flea market/thrift store, and failing that, post a "wanted" note on c.s.a.8 for a certain item, and failing that, if you want it badly enough, contact a vendor. Remember that this is their business; it's not just a hobby for them.

Besides, the recent American Technavision flyer has items for sale at prices which rival flea markets, garage sales and thrift stores.

And your quoted prices assume that the flea marketeers and thrift store operators know how to price their merchandise, which is quite false on many occasions.

>
>Linear RAM expansion will be available with the Mars 8 board.

Be careful with the terminology. All 65816's address memory as 64K
banks--i.e. if you have an Apple IIgs with 4 megabytes of RAM you
cannot loop through all 4 megabytes in one shot; you loop through 64K,
then switch banks, and so on. This banking is different from the
bank-switching of Atari 8-bit memory upgrades, but you can never go truly
linear with a 65816, as you can with a 68000. It is better than the 8086
segmenting scheme in some ways, though.

This wasn't meant to be a knock against the 65816, just information.

Hi, this is Nate, author of deana. I didn't know anyone actually got a hold of it, I lost my account shortly after writing it. I have yet to find a single person who got anadisk to read single-density disks except me. (It works perfectly. I must have something wierd going on with my drive controller.) I was able to write a program that formatted disks on my PC with a hybrid Atari/PC format. I could do a disk dup on the Atari from the original to the specially formatted disk. Every computer I tested (about 8) was able to read it back. Too bad my computer is still the only one that the format program works on. I haven't messed with that stuff for a while. Maybe I'll get it out and see what I can see. If only the PC's disk system was as inspired as the Amiga's!

Howdy Jason

Forget the above. I own one of them 800XE's and they do NOT look like 800XL's.

They are grey. Look like 130XE's. Have PBI and ECI. Furmer keyboard.
Faster RAM/ROM test. New PCB design (only 2 RAMchips but room for two more),
it even sais 130XE on the PCB. Mine came from Germany. They probably called
it 800XE since it reminds people of the 800XL. It DOES halve a FREDDY chip as
you say. When you choose "ALL TEST" at the selftest, it will "print out"
COPYRIGHT 1985 ATARI (don't know if that's the right order, but what the heck)
instead of 1983.

Howdy Tim

Hmm, seek problems when you put in a new disk. I have that with one of the
1050's. Started right after I disconnected, and then reconnected, the ribbon
connecting the head to the steppermotor out of curiosity. :-)

What I want to say is, maybe you head should be aligned. (make that, the head
of your disk drive.)

e >
e >Elmar Bongers, e-mail: elmi@extra.rwth-aachen.de

Howdy Elmar

The 1050 doesn't use the index hole. That's why it spins everytime you
change disks.

CSS (see vendor list) has a device that will allow you to format the backside
of a floppy.

BTW I don't know if they are still sold, but there once were floppies with
index holes on both sides of the disk. (The disk jacket had holes on both
sides, so the REAL index holes (the ones in the actual disk, the plastic part)
could be "seen" whether the disk was put in, in the normal way or "upside
down".

z >What I need now is something to plug the cable in to (such as an 850,
z >P:R: connection, MIO or Black Box) and some communications software.

Howdy Tim

The Black Box will not take the 850 cables. All others will.
( except the R:P:Interface Bob Puff is working on. It needs different cables
(different from both 850 and BB cables. Bob told me himself.))

BTW somebody did offer a BlackBox here. If I remember correctly she/he wanted
$120 for it.

e >
e >Try to ROT-13 a file twice. If you end up with the original text, it
e >works.
e >--
e >Eyvind Bernhardsen

Howdy Eyvind

Maybe not. If he uses the wrong methode of de/encodeing, the original and
the double encoded files will be the same, but the "unreadable" file might
not be ROT-13.

I know absolutely nothing about ROT-13 (didn't even know it existed), or what
it is, but I guess you could compare it with the following.

There are millions of way to "pack" a file (ARC, ARJ, ZIP, etc.).
If you try to write one of those packing and unpacking routines, you probably
gonna use the same algorithmes to pack and to unpack. So the first and last
will be the same. But if you do not use the "standard" packing routine,
the packed file will not be in the standard form. Or in plain English;
You might think you using e.g. the ARC format, and you (and anybody who has
your packer/depacker, can unpack it. But since it's not standard, other
people can not depack it, because it is not in a standard format.

3040. Long messages

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-06 00:00:00 UTC
From: mathniss@link.xs4all.nl
Message-ID: <3m1ldd$5c1@link.xs4all.nl>
Source record: 92742

Please folks

Do NOT send messages longer then approximately 200 lines.
Do NOT send FAQ's every month/week/whatever.

If one of us wants a FAQ, we'll ask for it.

If one of us wants your forsale or what ever list, we'll ask for it.

PLEASE PLEASE PLEASE PLEASE PLEASE PLEASE PLEASE PLEASE PLEASE

PabQWK can not handle large messages. I lose halve to two-thirds of my mail
due to this. I do NOT like to check out every QWK package I get, just to
enter every offset of these messages by hand, even do I wrote a utility to
do the math. for me.

Please. Most of the times, the FAQ's don't get changed. Most of us have a
copy of the FAQ, or know where to get it.

If you HAVE to post a FAQ, post it in small parts.

I only have my classic ATARI's (1x 128k, 3x 64k). I'm an 8 bit only guy.
I want to do more in the evenings then just fix PabQWK packages just because
Pab Sungenis put a major bug in his PabQWk 2.0 XE and some folks need to
send HUGE messages.

Yes, I do have me flame thrower on, I'm pissed off. #$%&@. (If most of the
users here from outside the USA, I would NOT censor ^^^^^^^)

k > one register!?)

(I deleted some stuff upthere.

Howdy Bill

Re: "drive sector length"

My question is: Why doesn't anybody use it?

The BlackBox turns 512 byte sectors into 256 byte sectors, just so any DOS can talk to modern Hard drives. Let's make this "user switchable" (I don't have the faintest idea how we should do this. Remember, I'm just the Brain Stormer) and then somebody could alter MyDOS (Hmm, who loves MyDOS and programs a lot?!? :-)) to accept 512 byte sectors.

This would put the max. partition size at 32 meg. instead of the 16meg we have today. drool, drool. hiss, hiss. Hmm, I get that's what you get when your brain runs hot and liquid starts comming from the mouth.

>all soldered, not socketed. The XEGS might be different.

The XEGS has a single ROM for OS, BASIC and missile Command. If you
replace the OS chip, you'll need an external BASIC. It is also soldered,
except for one of the graphics chips (at least on the XEGS I used to
own). As well, it uses 2 64x4 RAM chips. Its use of PORTB to control
the game and BASIC make it a pin to upgrade the memory. But,
aesthetically at least, it's one of the best looking 8-bits.

BC>Well, found a couple more interesting things I was woundering if anyone has
BC>or has seen;
BC>
BC>the Amdek AMDC I or II - 3" drives for the 8 bit, 360K/disk.

I've got one of these. I bought it about 2 years ago with hopes of
putting a 3.5" drive in it. I didn't get around to doing that (bought an
XF551 instead to do that) but it really is a unique unit. The 3" disks
are double-sided - meaning you can actually flip them over and the drive
busy light changes to a different color. The Amdek really is quite
a professional unit, complete with cooling fan but the 3" disks are impossible
to find. I've got the drive packed away in a box right now, but I just
may pull it out to play with it again...

Is that the one with the ghost that goes from room to room? I remember
seeing a demo of that, and never saw it again since. What a neat
game! :*D

I have Raster Blaster (Bill Budge), Night Mission (SubLogic), and Pinball Construction Set (Electronic Arts). Includes original instructions and some packing.

How about $10 each. Buy all three and I'll throw in two of my own BASIC renditions of board games: Mastermind and Black Box.

First reply gets them. I'll wait until Friday for someone wants all three. E-mail me directly if you're interested.

Thanks!

Help! I just got a 5200 without a power supply. I know it needs 11.5vdc
@ 1.95 amps with a standard atari 400/800 plug. I was wondering if any
of you atari gods out there know of any store that is selling a
transformer that fits these specs (or one that could be easily modified
to). The closest i have found with a quick call to radio shack is 12.6v
@1.2 amps or 3.0amps. Could one of these work?

Or is my best bet just to break down and buy one from one of those 'net
thieves' (no flame intended for all of you 'collectors' out there ;) who
will charge me an arm and a leg?

Ted B.

Whoa-hoa-hoa-MAN! :)

I've now got access to some REAL life->digital conversion equipment (color scanner and high-resolution color (vs. low-res. B/W ComputerEyes) video digitizer) which should hopefully get the ball rolling more quickly for Geneocide! >:^)

As for Cooltris 2, well, I've not touched it (or any other program for that matter) in a while but once I get more free time and more awake-time I'll try to finish more/most/all of it up! :)

I've had another game in mind for a while (ever since I saw a screen-shot of some new Japanese game for the SuperFamicom (SNES)). This one's called Mech-Andy and it's going to be a rather odd 3/4th perspective (I guess that's what it's called? Like Zaxxon sorta..) robot fighting game. I might do modem support, too, but... ya never know.

Also, I'd like to make an over-the-modem (or simply one player.. those can be good too) 2D tank battle game not unlike Bolo for the Mac. :) (What should I call it? Yeah, "Bill-o" came to mind. Nope, too cheezy! :))

I think I've officially killed OutBreak unless I can get DLI's working better <sigh>, and unless F.R.E.E. is an EXCELLENT game, enough to make me spend $20 on it and not want anything else, I may end up making a large Myst style 3D mystery game. (Whether the "reality" you're in is going to be video-taped real life images or 3D rendered imgaes is up in the air. Real life is much faster to get than waiting for a few 100 frames to render. :) But finding a good spot to tape is going to take some thinking.)

Anyway, so that's, at the moment:

Geneocide <- May be ported to DOS/Mac eventually
Cooltris 2 <- May be ported to DOS/Mac soon
Mech-Andy
Untitled tank game <- Maybe DOS, probably not Mac soon
Untitled mystery game

First out shall be Cooltris 2 as it's development is farther than anything else. Geneocide may be one of those forever-in-a-lower-priority projects, being made "behind the scenes" as other software comes out (mainly because they're quicker to do! :))

Now.. about NBS applications!

HyperIt! is in a cruical stage. I may scratch it. :(NEVER FEAR, THOUGH! In scratching it, I'll be redesigning it.. from (you guessed it!) scratch! I'm not as happy as I could be with the scripting language, and it all seems

so thrown together to me. Also, now that I've seen HTML, well, I know how to do things! :)

ScotchDUP.. Yeah, I'll do it. One day. (For those who remember, yeah, I can SEE why you're surprised! Especially with SpartaDOS out free now!)

MyBBS.. Once I get my R:P:Connection hooked up I may finally make a releasable BBS. (v.0.0 works ok (hitches and fool-proof-less) but you NEED an Action! cart. 64K can suck! >:^( )

Was there much else I was going to work on? :) If you've seen my home page (no, the URL STILL isn't "officially released" yet! :)) you know there are even MORE plans than these brewing, but for now, these are the most important/intriguing/coolest projects which I wish to work on. (EVERYthing on my home page is going to eventually get at least touched.. not necissarily finished (look at OutBreak) but I'll try..)

Hi,

>I wanna know.. what speed PCs CAN SIO2PC run on!? Can it even work on, like,
>a 386 or 486!? At ALL!?

I am running SIO2PC2 v3.19i (I think the last 2 stands for the two chip version of the cable) on my 486DX2/50 and it works very reliably even as the main window under MSWindows but as soon as I put it as a background task it doesn't work at all.

This is a real shame as I wanted to run WinTV in one window displaying the atari screen and sio2pc in another window.

Ivan

Source record: 92757

Hi,

I was wondering whether it is worth registering to get the upgrade from 2.51
to 3.01 as all of my atari games that I have tried to run on 2.51 have problems,
most don't even run at all.

The problems on the games that do run are:

* The display list interrupts happen on the wrong lines (usually about half
a line above where they should happen). This is even true for the diagnostics
screen when the emulator is in XL mode!
* The player/missile/background priorities are wrong.
* It can't handle screens of larger size than normal i.e. if the extra 3 lines
at the top of the display list are used for text.

Are any of these problems fixed?

Thanks in advance for any info on the registered version.

Ivan
ivan@rcp.co.uk

P.S. The games that I have found do work with only minor problems are DropZone,
BallBlazer and Tube Baddies.

> You have to realize that these drives (similar to the Atari's)
>have built in CPU's and operating systems.... they are not
>just drive mechs with some serial converter.

That's just the important point - these drives are built similar to the atari drives - I just want to connect one with one Joyport ('cause the 64 uses also only PIA ports) to get some files over ,but I could imagine that a connection to SIO will work (just connect DataIn and DATAOut with the 1541 DATA line) .They have a command line too !!!
Of course, you haven't to imagine that just a connection won't work without the nessecarily software !!!!
But if someone will go to write a new ROM for the 1541, I could imagine that it will work just like Atari Drives.

So I think it could work, but not just "plug and play" !!!
Matt

Call 'em for the latest flyer at 510/352-3787. There are a lot of brand stinkin' new games with boxes and documentation from $2.50 to $5. There are quite a few hardware bargains too, if you're in the market for what they have to offer.

>: And your quoted prices assume that the flea marketeers and thrift
>: store operators know how to price their merchandise, which is quite
>: false on many occasions.
>
>No, i posted the prices that i actually saw in stores, fleas, persons,
>vendores.

Those are *usually* close, but you'd be surprised how many clueless people there are pricing these things. I've seen a 400 (yes, a *400*) selling at a thrift store for $49.95. (Clueless.) Of course, I've also seen an 800XL for $6 (bought it, works great) and a few game cartridges for 49 cents.

Maybe these clueless "pricers," for lack of a better word, rationalize that 400 > 386, so a 400 must be worth more than a 386 PC. Heh.

>Could there be some sort of bridge between two of the data lines
>somewhere? (just asking) Hope this is of some help.

I don't know. I did manage to discover the bit 6 part of what you noticed; I hadn't analyzed it beyond that.

I've thought about writing a quick program with a few POKEs which will copy the character set from its current locations in RAM to another location (not much RAM in a 400, though) and then POKE the new starting character set address where the starting address is normally stored. I'd be curious to see what happens--it could either (a) work properly; (b) do the same thing, or (c) still malfunction but in a different way. Might not help much, but it should only take 10 minutes or so and will be good practice for character set programming.

It should be a simple program to write. Of course, since I don't want to hit RETURN before the program loads, maybe I'll write it in assembly (a rather simple loop, mostly) and create some executable code which I can rename AUTORUN.SYS. That way the program can boot up without requiring keyboard input first.

The strange thing is that if it's a RAM problem, as some have suggested, wouldn't it manifest itself in all graphics modes and not just text in GR.0? The fact that non-language (and non-keyboard input) cartridges work perfectly makes me wonder if it really could be the RAM.

Source record: 92764

Well, without having played much software on either 2.5x or 3.0x and having
done no real comparisons (except RubberBall :)), I can say:

1) I've found DLI's are still messed up some in 3.0 .. I think. :) Maybe
I'd better not say anything because I use 2.5 the most.
2) PMG/Playfield priority.. (oops.. I thought you said collision detection!
hehe.. well, that at least works some!) I've never done any tests regarding
priority. All I know is (and this bothers me because one of MY games
uses it! :)) PMG over a Graphics 0 or 8 image blocks it out (rather than
re-colors it). Oh well.. Darek said that would've been pretty difficult.
3) Screen size (overscanning) can be at the most, one line bigger than normal.
This isn't a PC XFormer problem, of course; this is an IBM PC problem.
VGA is only 320x200. The Atari's highest resolution is 320x192 (with
standard, default, OS-born borders) but can be bother horizontally and
vertically overscanned to fill more than a TV can see. (Of course, having
a Commodore 1084, I can shrink the screen and see what's REALLY going on
off of the sides! :))

Anyway, this probably didn't help too much. Oh well.. sorry!

Glenn! :) Inline JPEG isn't even a WWW STANDARD! :) GIF is about the only one. Netscape just happens to understand it. Heheh..

Ok, well, we could skip the graphics (for now) and do text/links only. That would be cool and is very doable.

Even if we decided to add DD3 fonts for a nicer looking interface. :)

Hell, if it were in a Sweet16 with a lot of RAM, we could maybe have a version of JViewXLish code we could jump to to do GIF decoding and resizing and then have it sent back to the browser! :)

As for newsreading.. that's EASY! :) The reply/email could even be a module (loaded in from HD, FD or RAMD) which gets loaded in when we need it.

I for one would LOVE to see some way of hooking to Internet for the Atari8 or AtariSweet16! :)

Non-standards that work for everyone except other people. :) Ahh...

sounds like

UUencode (MSDOS people seem to have problems. Atari YAU users REALLY do!)
ZIP (Sometimes Unix can't unZIP.. sometimes it can)

probably a few more but I've gotta dash

>know which signals go into the TV modulator?

The signals going into the modulator are nothing like RGB. They are
basically modified versions of comp. video, sound, 5V, GND, etc... Getting
the 8-bit onto an RGB monitor is a complicated issue since GTIA produces
nothing close to RGB in the first place. Right now, the only way I know
of to do it involves building a circuit to turn the RGB monitor into a
composite monitor, but you get no real gains in picture quality this way.

|> a 386 or 486!? At ALL!?
|>

I have run my SIO2PC on a 486DX50 (not DX2) a Toshiba T1000 8086 laptop, and a Pentium 60 machine(with some effort setting timing).

As for running under windows. I have never tried it, but my experience with serial ports under window has been awful. Windows seems to be notoriously bad and handling interupts from the serial ports in any sort of timely manner, and thus characters are lost.

I saw a mention of a unix version (for Linux) of the PC software. If anyone is actually working on this I would like to offer my assistance on the project.

Craig

P.S. I designed a pattern for etching PC boards for the SIO2PC a while ago (small enough to fit in an 800xl case even -- 1.25 inches square). If anyone is interested in it send me email and I can try to dig it out.

I've got it running on my 486 Dx2/66 and a 486 DX/100 without problems.
Now if only it would run in the background under Windows! ARGH!

: connection to SIO will work (just connect DataIn and DATAOut with the 1541
: DATA line) .They have a command line too !!!
: Of course, you haven't to imagine that just a connection won't work without
: the nessecarily software !!!!
: But if someone will go to write a new ROM for the 1541, I could imagine that
: it will work just like Atari Drives.

: So I think it could work, but not just "plug and play" !!!
: Matt

Well, I don't know much about Commie drives but is there slowless
inherent to the hardware or the darn dos on the chips?

It would be MUCH easier to just get a 1050 drive... they are usually
around for $30-$50 used.

Of course, if you want to write the darn code, burn the roms, etc..
and market it.. I'm sure someone with a sick sense of pride would purchase
it. =) (I only use the 1702 monitor cause Phillips made it)

Maybe you should check to see if the keyboard itself is working
correctly. Maybe there is a short somewhere...

or.. your keyboard decoding chips may be a bit off...
